Hay.

Scott, Magner & Miller say:

We have received on the San Francisco market during the past week 4900 tons of hay. This is a large amount to be received in six days, but we are right at the height of the season now and the hay is being readily taken care of. The above amount includes large consignments of alfalfa that have come in as well as other medium grades now being shipped in from the bay and river landings and arriving by boat.

With the rapid advance that has taken place in oats and in barley, and with the general feeling of a shortage in the better types of hay, it is not surprising to anyone interested in the situation to see our markets on hay advance somewhat. During the week there has been a decidedly better feeling throughout the entire market, and prices on the entire line of good grade hay are a little higher and the feeling at this writing decidedly strong with an advancing tendency.

There is very little of the choice grades of wheat hay or of red oat hay offering. These particular varieties are actively sought now.

Trade in alfalfa hay is now active and large lots are being moved from the fields into natural trade channels. This article stands on an entirely different basis from horse hay. There is no demand from Puget Sound for alfalfa hay such as developed last season when large quantities were shipped from this port into the northern markets. All of our alfalfa hay will have to be taken care of in the regular way and without any outside demand to relieve the situation.

Straw appears to be in better favor for the reason that the quantity is not as large as was estimated and the market is firmer.

We quote the wholesale prices in round lots on today's market as follows, viz:

Fancy wheat hay	16.50@17.00
No. 1 wheat or wheat & oat	14.50@16.00
No. 2 wheat or wheat & oat	12.00@13.00
Choice tame oat	14.00@14.50

Deciduous Fruit Market

Sacramento, August 26, 1911.

Manager F. B. McKevitt of the California Fruit Distributors reports:

The following gives the number of cars of deciduous fruit shipped from all points in California for the week (seven days) ending Friday morning, August 25, 1911:

Peaches—223¾ cars. Shipment of this variety shows a falling off of practically forty cars since last week. The decline will be even greater during the week to come. Salways will not be available in any quantity until about the 5th of September, although it may be possible to get a few carloads before that time. Not many Clings are available owing to large purchases of this stock by canners.

Plums—145 cars. This variety shows an increase in shipment from last week which was entirely unexpected by the trade. It is probable there will be a sharp decline during the coming week. Grand Dukes are nearly done and there are not very many Kelseys available.

Pears—268¾ cars. A decline is noted in the shipments of this variety, about the same as last week. The most important shipping sections have now finished on Bartletts and shipments should show a material decrease from this time on. Vacaville and Suisun are nearly done—most of the remaining stock will be sent from the mountain districts.

Grapes—301½ cars. The shipment of Thompson Seedless is now concluded. Malagas are going forward in considerable quantities and the shipment of Tokays is on the increase. It is expected that a few cars of the latter will be shipped from the Lodi and Florin Districts during the coming week, but there will be no considerable quantity to offer until after the first of September. A limited number of cars of Black Prince are still available.

Weather conditions are fine.

Comparative Statement of Shipments.

	August 19, 1910	August 19, 1911
Cherries	250½	216¼

Citrus Fruit Market

LOS ANGELES, Aug. 30, 1911.

There has been practically no change in condition of the market. The heavy crop of Eastern deciduous fruit offered still shows its effect on Valencia sales, but shipments are beginning to go out a little heavier, amounting to about 25 cars daily.

Shipments.

Shipments of oranges to date since November 1st, 1910, 35,439 cars, lemons

Cream Separators, all sizes and prices. Guy F. Kelsey & Co., 106 East Eighth St., Los Angeles, Cal.

6,121 cars, total 41,560. To same date last season: Oranges 24,385 cars, lemons 3,254, total 27,639.

NEW YORK, Aug. 28.—Twelve cars Valencias, one car lemons and one car grapefruit sold. Market higher on large sized Valencias, easier on small sizes. Market higher on lemons. Fair and warm.

LIKES THE MEADOW LARK.

Speaking to a reporter of a daily paper regarding California birds, John Burroughs said:

"No, I don't like your mocking bird or any mocking bird so very well. Oh, yes; he performs most wonderful feats but he is only a vocal gymnast—an actor. He is too theatrical to suit my taste. I have seen him in Jamaica, Florida and elsewhere and he is always the same plagiarist. His is not a serious song like that of the thrush. His ways are disagreeable, too. He is continually flirting and preening and lacks in dignity.

"Bird songs, of course, are often made dear by association, and the mocking bird has been surrounded by much to endear him. Compare his song with that of the meadow lark.

"I would exchange meadow larks with you. Yours in the West has a sweeter song. Our eastern meadow lark sings ecstatically 'Spring of the Years.' Yours has not been put to words yet for me. It is beautiful and comes bubbling up in a wonderful ripple of melody from the little bird's soul. No mocking bird song in that."

"Really, I like the blackbird's squeaky little song because it is his own. The blackbirds here are very interesting. They are so glossy and black, so well groomed, such high steppers and show such friendliness.

"I have not seen many robins here. A few on the lawn are about the same as our eastern robins. There is also a pretty thowing, a finch, that's like our chewink. The chewink, though, is more brilliantly colored.

"One of the most interesting birds I have seen," continued the bird lover, "is the Pasadena thrasher—that is the name that was given to me. It acts like a mocker and has a long flexible tail. He has a hooked beak and when he hooks for insects he makes the dust fly. I call him a muckraker.

"At Mt. Wilson I made acquaintance with a pretty bird, the purple marten—a bird with a rich warble.

"Your bluebirds are beautiful. There are the mountain bluebird and the Arctic. The latter especially is like a flash of blue sky. There are plenty of jayhirds in your mountains and they are very handsome.

"Another mountain bird is the titmouse. He is similar to our eastern titmouse, which sings a song saying, 'Peter, Peter, Peter,' and consequently is known as the Peter bird."

Do your cows milk hard? Send 50 cents for teat expander. O. J. Weber Co., 225-227-229-231 East Sixth St., Los Angeles, Cal.

GREAT VARIETY, HIGH QUALITY.

Those of our readers who visit San Francisco will be interested in knowing that the Geo. E. Dow Pumping Engine Co. have opened a display room at 179 First St.

This concern manufactures a greater variety of pumps than any other one concern in the world. Selections from these many types are on display in this place. Many of them are set up and operating.

It will be an interesting feature of your visit to San Francisco to examine the great variety of pumps shown here for every possible service and for every possible use.

All visitors to San Francisco are cordially invited to meet the representatives of the Dow Pumping Engine Co. at this place.

Kern Meadows Land & Water Company will begin operations this week upon its property in Kern County. F. M. Bartell left several days ago with stock, and farm implements have been shipped to begin immediate operations upon an experimental farm. Ditch grading machinery has been purchased and will be in operation very soon upon the distributing system to carry the artesian water over the property. This work will be in charge of Herbert E. Carse, consulting engineer. The wells have been flowing for many years, the water running at random over the land and making dense jungles of tule and grass. The wells will be capped and the tule land placed under cultivation. The experimental farm will be devoted to determination of crops and deciduous trees best suited to soil and climatic conditions. The lands have not been under cultivation for a number of years, but foxtail in abundance, large gum trees, pomegranates, grape vines with trunks four to six inches in diameter and olive trees twelve to fifteen feet in height loaded with fruit give evidence of the possibilities. The land is now being rented and the whole 10,000 acres will be placed under cultivation as soon as possible.

A Six by Ten Foot Pump House

Factors to Consider in Choosing Pumps

A centrifugal pump consists of a rapidly revolving runner or wheel turning inside a casing. The water is led in to the impeller, corresponding to the spokes, at the hub and is thrown outward by centrifugal force.

Avoid a pump with many complicated water passages. Be sure the shaft is strong enough to withstand the belt pull. Be sure it is in perfect mechanical balance. Do not accept a pump that vibrates when running at full speed. This is particularly imperative with a direct-connected pump. There is a strong tendency in the pump runner to pull to one side. This is called end thrust and a pump that is designed to remove this thrust is said to be hydraulically balanced.

is large enough for a

Meets Every Condition Enumerated

Layne Patent

Centrifugal Pump

Steel Pit and Screen

Wherever possible, buy a direct connected pump. The first cost is not materially greater when you consider the extra cost of belting, foundations and belt-way. Direct connected pumps take less power to operate them, for at least fifteen per cent of the power is consumed in the belt. In many cases a new belt is required each year, no small item of expense. It is important that the manufacturer know the exact height the water is to be pumped before your order is placed, as direct-connected pumps are always made to order. This also means that a little longer time will be required for delivery. Buying from a reputable firm is even more important in this instance.

The best way to be sure of getting an efficient pump is to buy of a reputable firm which has had long experience in building pumping machinery.

To sum the whole matter up, get a simple pump without any fancy automatic devices, with strong bearings and a shaft of ample size and with its weight well distributed, and then buy from firms who are experienced pumping machinery builders.

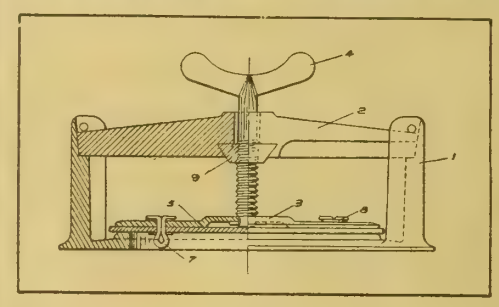
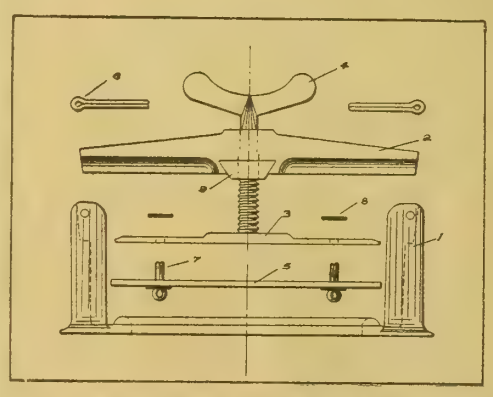
POMONA CIRCULAR VALVE





THE main object of the Pomona Valve is to construct a very cheap and simple valve, and one that requires no special tools or wrenches or experience to operate.

The Pomona Valve is constructed with non-corrosive parts, thus insuring a workable valve regardless of infrequent use. All fastening held in place by cotter pins, thereby making a very cheaply constructed valve and yet a very substantial one.

The Gravenstein Apple Show at Sebastopol

Editorial Correspondence from Sonoma County Gives Condensed Report of Great Show of One Variety of Apple.

"Gold Ridge" is a name which carries one back to mining days and suggests a soil rich in the glittering yellow metal. It reminds one of the feverish hunt for gold in the days of '49 and for many days thereafter. The hunt still continues and the Gold Ridge located in Sonoma County a few miles west of Santa Rosa is proving remarkably rich in yellow gold. The process of its manufacture is roundabout; the name is not given because of a deposit of metal but because of the richness of the soil from an agricultural standpoint. This was recognized in 1892 and at the suggestion of a Sebastopol woman the name was applied to a range of hills running north and south of that thriving little city. On an edge of this ridge are Sebastopol, Stony Point, the Pleasant Hill country, Forestville and Graton.

More than 100 years ago the Russian immigrants locating along the northern coast of California, brought with them scions of the Gravenstein apple. These, with many other fruits were there planted on the rich hillsides. For many years the excellence of the apple in that section was noted, but only within a very few years has its commercial importance been appreciated. The Gravenstein has the advantage of being an exceptionally early fruit of the very highest quality. Some enthusiasts have gone so far as to say it is "the best apple on earth." In any case, the unbiased judge must admit it is reasonably good.

Something over a year ago certain boosters of the Sebastopol section decided that the merits of this excellent apple should be given wider publicity, and to that end a movement was started to enthrone King Gravenstein for one week. This resulted in a remarkably successful apple show, probably the first in which one variety of apple was used in the exhibitions. The success of this show called for a repetition, this year, and the week ending August 26th the second exhibition was given.

The most noticeable thing on entering the tent was the delightful Gravenstein aroma which filled the atmosphere as does the orange blossom during the month of March. The exhibits were arranged around the outside of the tent built especially for the association, with two banks of exhibits through the center. Of carload entries there was only one, but the fifty-box competition drew out several of the very highest grade. Many apologies were made for the lack of coloring which is one of the features of the Gravenstein. In order to color up the fruit as much as possible a week's delay was made in the opening of the show. While the fruit was not so highly colored as in former years at the same date, the quality was of the very best, but we note that the fruit belonging to Mrs. Hunt which won the first prize was of the very highest color of any exhibit of the same size. This award was a tribute, in part at least, to the color, though it must be confessed that the uniformly good size, together with high quality and regularly sized fruit, made the decision of the judges unanimously acceptable to all who saw the exhibition. The exhibits of commercial pack did not take with the general visitors as did the feature exhibits. Here ingenuity and artistic taste joined in producing remarkably novel and interesting effects.

A Sonoma County Gravenstein Orchard.
Courtesy Sebastopol Times.

The first prize winner and one of the most striking of the feature exhibits was immediately in front of the main entrance. It was a large reproduction of the steamer Gold, an old time vessel which plied between San Francisco and Petaluma, excepting as to its framework, entirely in apples. The reproduction was made most real by the motion of the paddle wheels kicking up a great froth in the real water in which it floated. Around the miniature lake was a bank of growing grass, and a flock of ducks added reality to the scene. On the steamer's deck were boxes of apples going to market. This was exhibited by the people of the Pleasant Hill district. Stonypoint carried off second prize for its old water wheel, a mammoth wheel ten feet or more in diameter, kept in constant motion by a very real waterfall, continually grinding out a stream of Gravenstein apples and pies. But a description of all the exhibits would weary the reader who was not so fortunate as to see them, and would take more space than is at our command, but we can say in a general way that it was one of the prettiest arranged little shows we have ever seen. Almost every exhibit was executed perfectly. One of the most attractive was that of Luther Burbank in which he showed a large number of his more recent productions. It will be recalled that Mr. Burbank's home is at Santa Rosa, seven miles from Sebastopol, and his principal experiment grounds are just at the entrance of the city. Mr. Burbank saw many years ago the richness of Sonoma County's soil and the abundance of moisture retained, and determined to make it the scene of his work, the influence of which is world wide.

The main tent in which the exhibition was held is 110 by 260 feet with an annex 30 by 200 feet for concessions and orchard appliances. Several of the noisier, like the spraying outfits, were located in the grove immediately back of the tent.

Regarding the association and its work Mr. E. F. Jewell, the secretary, supplies us with the following information:

"The Gravenstein Apple Show Association held its first show in August, 1910, which was the result of considerable talk and argument on the part of a few of the boosters of this section. We knew what we possessed in the way of fruit and vegetable products that were in great demand, and decided that we would present them in some manner before the people of other parts of this great state as well as the United States. The manner in which to accomplish this purpose was next to be considered, and after considerable argument and planning on the part of those interested, it was finally decided to give the Gravenstein Apple Show, this being our leading product.

"Immediately following the decision, we began to act. A meeting of the growers and citizens of this section was called, at which time a board of directors was elected as well as the officers, who at once started in upon their duties to put up our first show. This first meeting was called in May, which only left us three months in which to complete arrangements, and on account of the work being new to most of us, we found it to be quite an undertaking. However, the date was set for August 10th, and at the time appointed, the displays were all complete, and our first Gravenstein apple show was ready to receive the criticism of the public.

"The great success of this show decided us in making it an annual fair. We at once incorporated, and proceeded in a business-like manner to carry out our plans."

J. P. McDowell is president, and the other directors are: A. B. Swain, W. I. Newcomb, F. W. Maddocks, J. W. Turner, Geo. D. Sanborn, Charles E. Hotle, E. E. Morford, Henry Elphick, J. P. Kelly, W. W. Monroe, George McFarlane, H. R. Harbine, J. J. Alves, L. V. H Howell, E. H. Brown, secretary of the Sonoma County Chamber of Commerce, is director-general of the show.

Sure it is the show succeeded in attracting attention of a great many people to Sonoma County. The attendance was most liberal during every day of the show, and visitors were present from many counties from Los Angeles to Shasta. Watsonville boosters were in evidence and were received with a glad hand by the Sebastopol people. The Apple Annual people want it understood that they have greatest admiration for the Sebastopol show but were more than anxious for all to come to the next Apple Annual to see the Bellflowers, Newton Pippins, and Winter Pearmains show forth their greatest beauty.

Regarding Sebastopol and its Gravensteins, Mr. Geo. D. Sanborn writes us:

"Sebastopol is located seven miles west from Santa Rosa, the County Seat of Sonoma County. It is a bustling incorporated little city of some 2000 population, and is the hub of the Petaluma and Santa Rosa Electric road, as well as having direct communication with San Francisco over the Northwestern Pacific railroad. The apple industry is assuming, and has already reached vast proportions here. The soil and climatic conditions seem to be as near perfection for the production of all kinds and varieties of apples as can be found in California, if indeed not in the world. The Gravenstein is the best and most delicious of all apples and is produced to greater perfection at Sebastopol than elsewhere on the Pacific Coast. The area that will produce this apple to its perfection is limited here, yet there is much of this area that has not yet been planted to apples, and there are many hundreds of acres here in young apples of various ages that have not yet reached the bearing point The industry is growing very fast and there is absolutely no danger of overproduction of the Sebastopol Gravenstein for the reason that the area is limited, and from the fact that the Sebastopol Gravensteins are about four weeks earlier than those raised in any other portion of the Pacific Coast. They absolutely cannot compete in the markets with the apples of this variety raised here for the reason that they are hanging on the trees green, while Sebastopol is marketing her crop at big prices."

Citrus and Tropical Fruits

PROPER PRUNING OF THE ORANGE TREE.

Regarding pruning of the citrus T. R. Wallace writes in the Florida Agriculturist:

Pruning is a phase of orange culture which receives meager attention by the grower, and yet is one of the important details. It is usually discussed in a very general way and with a sort of tacit acceptance of the theory that evergreen trees do not need pruning except to remove accumulations of dead wood. The writer's study of the subject has been through direct experiment and in closely observing the experiments of others, and the object of this study is to find what methods of culture must go hand in hand with the use of fertilizers to obtain the most desired results with reasonable certainty. The direct issues in mind were quantity and quality of fruit, and the striking fact that, in the attempt to produce quantity by direct fertilizing, an abundance of fruit wood was evolved which went dead instead of producing fruit. This dead wood being invariably found inside the tree, the investigations naturally led to the study of that part.

Presuming that in a suitable soil and climate we have an orange orchard on healthy root, and that the trees are kept healthy by proper soil fertilization (which simply means correct farming,) and we are feeding the trees with useful fertilizers to insure steady and desirable fruiting, can we by pruning enhance the value of our crops? I answer that we can.

The inclination of the citrus trees after a few years is to grow top, and the top usually forms like a pyramid over the center of the tree, shutting out the light and air from the center or inside of the tree. This deprives the tree of considerable bearing surface inside and the crop is borne mostly on the outside. As this becomes habitual, even though we fertilize ever so cleverly to produce fruit wood, the interior fruit wood dies from simple inanition, and practically the bearing of inside fruit stops. This cannot be corrected by simply cleaning out the interior of the tree nor by thinning out fruit wood from the side. The letting in of light and air through the sides of the tree is of no important value, and indeed the denser the foliage of the sides the better protection the outside fruit will have from winds and severe climatic changes.

Practically the pruning of the orange tree consists in removing the branch reaching up and enclosing the center-top and the opening out of the center so that the air and light can freely descend upon and into the cup-top thus produced. This permits the tree to prepare and nourish an inside rim or surface of fruiting wood, and to bear fruit on it. Practically that provides two fruiting surfaces, an outside and inside. The taking out of the top allows more strength to concentrate in the lower sides and they become rich and strong to the ground, so that they not only produce more fruit, but afford their crop more protection by dense foliage. Thus an increase in both quantity and quality is effected. But this is still further augmented by the crop grown inside. This inside crop is as well very superior fruit for packing, as it is protected from the wind, and as well there is always a sufficient thin foliage swinging over the inside rim of the cup to protect from sunburn.

In such pruning only the saw is required, and care must be exercised to cut all limbs fully back to the eye, and no limb should be nipped or cut on any part of its length or between buds, as in such case it will either die back or sprout like a broom. This method of pruning is not expensive, and can be done very quickly by anyone who can handle a saw properly. It cannot be done periodically every few years, but each year the trees should be gone over. The first year it will be found that but one, two or three limbs can be profitably and safely removed.

The next year another limb or two can be removed, until the proper inside shape and healthy fruiting wood is produced. The increases both in quantity and quality of the crop will more than offset the seeming loss of crop suggested by removing the central limbs reaching up into the top.

NOTES.

California soils, though often very fertile, are generally deficient in humus.

The only places where green manures are being used extensively are the citrus and walnut orchards of the southern part of the state.

By the use of green manures a generally improved condition of orchards has been secured, as shown by a more healthy appearance of the trees and more and better fruit.

The early seeding of green manure crops is desirable for obtaining the best results.

Green manures should be turned under before the trees start new growth in the spring.

Heavier seeding than is ordinarily practiced is advised.

Common vetch and field peas are the most generally used green manure crops, the vetch being the most popular.

Peas or common vetch sown in the fall without irrigation will not, except in the most favorable years, make a sufficient growth to be turned under early as a green manure, but when thus sown will make a good growth later in the spring.

Bur clover seems to be of most value for deciduous orchard conditions, while the woolly-podded vetch promises to be of value for the same conditions.

Green manure crops need no inoculation in California, horse beans in the northern portion being the only known exception.

The growing of a summer green manure crop in California orchards is not advisable.—Bul. 190, Bureau Pl. Industry, U. S. Dep. Ag.

COVER CROP SEED PER ACRE.

Green manure crops used in California in their order of importance are: common vetch, Canadian field peas, bur clover, fenugreek, hairy vetch and Indian melilot. The amount of seed per acre is approximately:

Vetch (Vicia sativa)	40-60 lbs. per acre
Canadian field peas	80 lbs. per acre
Bur clover (hulled)	20 lbs. per acre
Fenugreek	30 lbs. per acre
Hairy vetch (Vicia villosa)	45-50 lbs. per acre

NOTICE

To Users of

FUMIGATION CYANIDE

Quality is the Important Consideration

Do Not Be Deceived

Should someone offer you so-called Cyanide of Potassium at a price below the market, it is safe to assume that it will prove to be a

Low Grade Sodium Cyanide

carrying from 7% to 15% of Sodium Chloride. **Such cyanide bears no manufacturer's brand or label.**

It is Your Right to Receive an Analysis

The new State Law governing the sale of insecticides and fungicides provides that an analysis be printed or pasted on each case or package of such material. This law was framed by the agricultural department of the University of California; you should receive the protection it is intended to afford. INSIST ON AN ANALYSIS.

If any doubt exists of the correctness of analysis furnished you, send a sample of the material to the Agricultural Department of the University of California, which will analyze it for you for the nominal fee of $1.00.

Fumigation with Cyanide involves a heavy outlay of money and (when inferior chemicals are used) too great a risk as to the effect on citrus trees, and the condition of the fruit, for any grower to remain uninformed on this subject, when authentic facts compiled by the United States Department of Agriculture may be had on application.

Bulletin No. 90, parts 1-2-3, of the United States Department of Agriculture, Bureau of Entomology, on "The Fumigation of Citrus Trees," "Chemistry of Fumigation with Hydrocyanic-Acid Gas," "The Value of Sodium Cyanide for Fumigation Purposes" are publications which should be read by all growers who have any interest in the extermination of the several varieties of scale.

READ WHAT PROF. R. S. WOGLUM OF THE UNITED STATES DEPARTMENT OF AGRICULTURE SAYS:

"Past experience in this state with a 98-100 per cent. SODIUM CYANIDE has proven unsatisfactory. Why? I will tell you the reason.

Chemical analyses have shown that practically all commercial potassium and sodium cyanide contains more or less common salt, which is technically spoken of as sodium chloride. The action of this salt in connection with fumigation demands consideration. It has been found that when sodium chloride is present in the reaction of sulphuric acid on a cyanide in the production of hydrocyanic acid gas that this chloride salt produces a secondary reaction which liberates an acid called hydrochloric acid; that this liberated hydrochloric acid immediately attacks the liberated hydrocyanic acid gas and decomposes it to a great extent. Hence, as the presence of sodium chloride in a cyanide produces a partial decomposition of the hydrocyanic acid gas when liberated, the ultimate result is that less gas is given off than from a cyanide of the same degree of purity which is free of it. The extent of the decomposition depends upon the amount of sodium chloride present. That this might be great is shown by the results of one experiment performed by the United States Bureau of Chemistry in which the decomposition amounted to little over 92 per cent of the total gas, only a little over seven per cent being evolved."

CONDEMNED AS UNFIT FOR USE.

"The results of these experiments bring to our attention a second consideration in the purchasing of a cyanide. That a cyanide be of a certain grade of purity is no longer the only consideration.

"It is of equal importance that the cyanide be practically free of sodium chloride. **I would condemn as unfit for use in fumigation any cyanide containing in excess of one per cent of sodium chloride.** Returning to the high grade sodium cyanide, it was found that this as well as the high grade potassium cyanide, contained only a fraction of a per cent of sodium chloride. It generally can be held as a safe consideration that a cyanide approaching chemical purity will contain not more than a trace of sodium chloride and that such a cyanide generally can be safely used, even though the degree of cyanide purity is alone known. I would consider as generally satisfactory for fumigation, a potassium cyanide 96 per cent or above, or a sodium cyanide 124 per cent or above. Chemicals of lower purity should never be used. Preferably the grade demanded should be a little higher than that given, or a potassium cyanide 98-99 per cent."

The Kind of Cyanide to Use

The Roessler & Hasslacher Chemical Co.'s Guaranteed Cyanide of Potassium (98-99 per cent) and High Test (128-130 per cent) Cyanide of Sodium are manufactured expressly for fumigating and contain no reactionary chemicals. The manufacturers of this material have studied the requirements necessary to produce definite and dependable results.

IT GENERATES QUICKLY, affording the required degree of density of gas under the tent.

CONTAINS NO CHLORIDE OF SODIUM, insuring the highest efficiency and maximum evolution of Hydrocyanic acid gas.

To the Water Well Owners and Drillers of Southern California

We beg to introduce ourselves and ask for a chance to prove worthy of your permanent confidence and patronage.

We have found that with some additions, the complete line of oil well supplies which we carry at Los Angeles and in our branch stores, is admirably adapted to supply the needs of the water well trade, and we are entering this field with all the vim and vigor which have built up our immense oil well business in the past five years.

If you are in need of an engine, pumping outfit, casing, belting, tools (small or large), pipe, fittings or supplies of any kind, we will be more than pleased to serve you. You will find our goods of the better grade only, our delivery prompt, and our prices the very lowest, consistent with first quality.

We will take pleasure in supplying any quotations or other information you may desire and will appreciate an opportunity of making your acquaintance.

Ask for our special bulletins on water well supplies. Mailed free.

Deciduous Fruit Culture

DYNAMITE THE LATEST AID TO FARMING.

The latest development in agriculture is the use of dynamite. At first thought this word makes the ordinary soilworker shudder, but there is nothing about this high explosive to cause the least fear. In fact, it is the farmer's friend and the farmers who make early use of it in their field work will have a distinct advantage over those who wait a score of years to find in the end that progress demands that they use it.

Many look upon dynamite as they do upon lightning. They think both uncontrollable. This is a serious mistake. Dynamite is neither treacherous nor uncontrollable, but is dependable and tractable. It is its dependable and tractable qualities that make it so valuable. Once one has gained the knowledge of how to use this substance and knows its power, there is not the slightest danger in its use by careful and thoughtful persons. It can be handled and used just as safely as gasoline, kerosene or any other of the many substances that have either great power and energy in themselves or the ability to develop that power and energy in other substances. The energy of dynamite can be directed in the work to which it is adapted just as well as the energy of steam can be directed, in the work for which it is used. With this view in mind one can easily understand how serviceable and economical dynamite is in the heavy work necessary to modify, conform or perfect any piece of land that is not up to the agricultural standard.

The work done by dynamite is accomplished by the sudden transformation of a relatively small volume of solid material into a very large volume of gas. To secure the greatest execution and economy the dynamite should be confined as closely as practicable. Dynamite will show considerable effect if exploded in the open air, but its efficiency is increased many times if it is closely confined in the bottom of a bore hole by packing damp clay compactly above it to the surface of the ground.

For years dynamite has been used in the West for many farm purposes, but its use during that time has been limited almost wholly to that region. We have waited long for the perfection of dynamite to a state where it could be safely used on farms generally, and for a sufficient tryout to prove its feasibility under all conditions. Both have been realized.

There are three ways of blasting those great boulders in your cultivated fields that have caused the ruin of so many plow shares and the utterance of hard thoughts as the plow handles tickled your ribs. The easiest is to press a number of cartridges of dynamite into a compact mass against a flat or hollow side of the boulder, cover this over with a coating of plastic clay, and then explode it. If sufficient dynamite is used the boulder will be broken into many pieces, but much more dynamite is required to break it in this way than would be necessary if the charge were confined against the under side of the boulder in the bottom of a hole made with a pointed crow bar. Still less dynamite will break it in pieces if exploded in holes drilled into the boulder itself.

Equally as detrimental to cultivation and good husbandry in general is the presence of old stumps and worthless trees in the tillable areas, brush and second growth in the pasture and dead and dying trees in the orchard. These can be disposed of quickly by making one or two holes with a pointed bar well down under the roots and exploding a cartridge or two of dynamite in each hole. In such a case all of the dynamite used should be exploded simultaneously, so when it is loaded in more than one hole the charges should be connected up electrically. After the stump or tree is uprooted it can be quickly split into firewood by boring a few auger holes half-way through it and exploding a small quantity of dynamite in these.

Every little dry spell has its telling effect upon crop production. There is just one reason for this and that is the shallowness of the top soil and the hardness of the subsoil.

For years and years the plow has been run to the depth of the top soil, causing the upper portion of the subsoil to become a cemented, impenetrable hardpan, impervious to water as well as the roots of plants. The crops growing in such soils cannot send their roots down into the subsoil to secure the moisture, food and coolness below, but must grow solely in the few inches of soil that overlays the hardpan. In a time of continuous rainfall this upper stratum of earth soon fills with water, and since there is no outlet below the surplus water must run off over the surface, causing washing and transporting of the plant-supporting earth, while in a time of dryness the entire root system, being but a few inches beneath the surface and unable to penetrate the subsoil, suffers severely.

The subsoil on many farms runs so close to the surface that profitable crop production is almost impossible on these areas. To materially deepen them is impracticable with the plow for the plow turns the subsoil to the surface and this if present in large quantities, seriously interferes with plant growth. It is right here that dynamite has its greatest use in our practical farm operations, for when it is properly used it can be made to crumble and shatter this impervious subsoil to admit the plant roots without bringing the subsoil to the surface to interfere with the growth of the crops. The result of breaking up this subsoil is that the moisture-absorbing and moisture-holding soil is increased from a few inches to five or six feet immediately with no harmful effect on the present crop to be grown nor those that succeed it. Many other benefits are derived from this breaking up of the subsoil aside from its regulation of the moisture supply, principal among which is that the feeding surface is increased a hundred fold, the plants can get a better grip on the soil and the locked-up plant food is made available to the crops.

In blasting subsoil holes are drilled with a dirt auger or pointed bar from two and a half to five feet deep, according to soil conditions. These are spaced from fifteen to twenty feet apart, and a quarter of a pound of a slow-acting dynamite exploded in the bottom of each hole. By packing the hole tightly the entire effect of the explosion can be kept below ground without disturbing the surface to any great extent. The cost of subsoil blasting including labor does not exceed an outlay of more than fifteen or twenty dollars per acre.

The California State Fair

A Good Exhibit, Fine Races and Some Features Not Admissable

With a $10,000 prize hung up on a single race at the state fair which closed in Sacramento last Saturday night, it may be imagined that the two monster grandstands were crowded during that event with an enthusiastic noisy throng. The boxes were filled with society people of all California, judges of various courts, and even the Governor himself smiled on the proceedings. This event was on Wednesday, and the preceding day had witnessed one creating almost as much interest and enthusiasm. This was the $5000 race, in which Teddy Bear made the fastest time ever made on the Sacramento track, 2:05. The liberal prizes offered for these harness events had brought some remarkably fine animals to the fair, but while the enthusiasm was intense, it was stated that the gate receipts were under those of last year.

The criticism voiced the loudest was directed against this liberality with the racing events. The live stock people and manufacturers felt that too great an effort had been made to encourage track events, resulting in detracting interest from other features of the fair. It was noticeable that during the principal track events all other portions of the grounds were nearly deserted.

The premiums offered on draft horses, beef and dairy cattle and horticultural products made a pitiful showing in comparison with racing prizes. Take for instance draft horses. The highest premium offered was $20. In registered cattle the highest premium was $25. In the dairy division an especial effort was made on the five days milking contest prescribing three milkings per day in charge of experts of the State University. In this there was most intense interest, as it meant much for the advancement of the dairy interests of the state, yet the first premium was $50, second $25 and third $15, with similar premiums for cows under three years.

In horticultural products there was more liberality, the best exhibit of peaches, pears, apples, plums, grapes, citrus fruits, and dried fruits and varied exhibits called for a first premium of $50 in the special premium class. In the citrus exhibits the various fruits called for $20 first premium, with others running down to $2.50, and these citrus fruits alone bring to the state between $30,000,000 and $40,000,000, yet the entire citrus class commanded only $122, yet a few minutes' contest of trotting horses was allowed to command $10,000 and to be taken out of the state.

The most liberal in the special prize list was for the county exhibits, these to consist of agricultural, horticultural, viticultural, manufacturing and other industrial products of the county. In this class the first prize was $600, others in order, $400, $250, $200, $150, $100, $75 and $50. These premiums brought out some remarkably fine exhibits. Most of these were in the main pavilion, but a few were crowded out to an annex of frame and cloth between the main building and the machinery hall. This was made necessary because of the granting of space to concessions which should have been given to exhibitors. Soft drink booths with noisy spielers occupied some of the most prominent locations in the building. Placer, Sutter and Imperial Counties were thus crowded into the annex. Imperial County's representative plainly expressed his disapproval of crowding out an exhibit which had been sent nearly 700 miles. That the granting of these concessions, or at least some others, brought features of a rather low grade on the grounds is to be regretted.

But all told it was a good agricultural fair and the closest to the Simonpure article we have seen in this state. The exhibits of machinery, especially the traction engines and pumping plants, were remarkably good. There were dozens of traction engines of many different varieties. Farm implements also came in for a good showing. Combined harvesters and other machines and implements peculiar to the West were in evidence.

Live stock exhibits showed the greatest increase. The Berkshire hog class nearly doubled former exhibits. Poland-Chinas were not so generally exhibited, but some remarkably fine stock was on exhibition. Sheep classes were well filled. In beef cattle one of the strongest exhibits was by the Herefords. Representative Red Polled, Shorthorns and other beef herds were also exhibited. The Dutch Belted attracted much attention, though one county furnished the entire offering in this class. The beauty of this peculiar breed makes fine show animals. Speaking of the Dutch Belted reminds us that we failed to mention the Hampshire hogs, of which there were several exhibited. These animals are marked similarly to the Dutch Belted cow, excepting that the belt is farther forward on the body. Draft horses and coachers were perhaps not so strong as in other years. The dairy class was well filled and the contest in the new "cow parlor" was most attractive, and at each milking time many were present to observe the methods followed. Inspection was by a representative of the State University.

The poultry exhibit was also the largest ever made on the state fair grounds. Something over 1850 birds were shown by 288 exhibitors. Most of the classes were exceptionally well filled with a high-scoring lot of birds. Strange as it may seem, the Leghorn, probably California's favorite utility fowl, was one of the lightest classes. The exhibit of pigeons was exceptional as to numbers, but good judges informed us that they did not score as high as the same number of birds exhibited a few years ago would have done. Besides the birds exhibited, five supply houses made extensive exhibits of incubators, feeds and all kinds of poultry supplies. This was considered most fortunate in view of the fact that last year not a single house exhibited at the grounds.

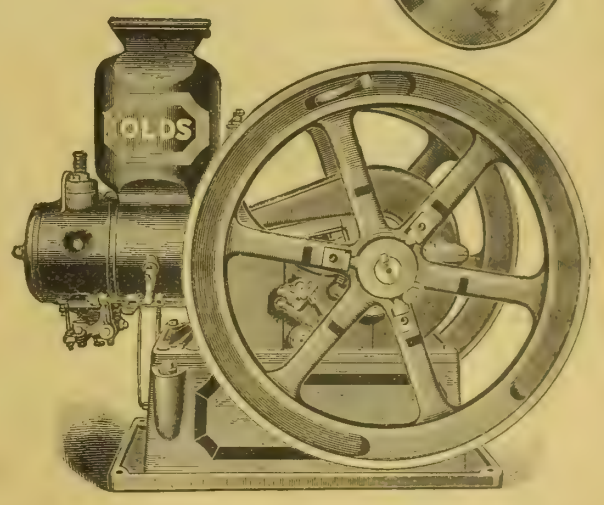
FREE this real leather bill fold for the Head of the Farm

(Not for boys—they're all right and their turn will come later—but this is for the boss.)

Thousands of farmers will buy gasoline engines this Fall. I want to get in direct and personal touch with every one of them, as I want them to know about the Olds Engine.

If you are going to buy an engine, or are thinking about it, you ought to know what an Olds Engine will do for you. I want to tell you about them—give you just the information you want—so if you will fill out the coupon below (or write me a letter) saying what size engine you want, whether portable or stationary, and when you expect to need one, without asking you to make any promise or obligating you in any way, *I will send you absolutely free* this genuine calfskin bill fold, stamped with your name in gold letters.

It will hold fifteen bills easily. When folded it will go in a small pocket. It is very convenient, handsome and useful; will last a lifetime. Has no advertisement on it.



OLDS GASOLINE ENGINES

are known the world over and used by farmers everywhere. They are the most satisfactory engine made for farm work. I guarantee them to do all we say they will—you to be the judge. Ask any man who has an Olds Engine. He will tell you.

We also make complete electric light and water systems especially for farms.

Write for our prices on corn shellers, corn huskers, feed grinders and cream separators.

If you are going to buy an engine, put a check mark (X) in the place showing the size and style engine you want, and when you expect to need it, and mail to me personally at once. Address me as below.

FILLING THE SILO.

(Concluded from last week.)

Adding Water During Filling.

Ordinarily corn cut at the proper time does not need any water added to make good silage. There are times, however, when it is necessary to add water to the corn in filling the silo. The corn in the silo at the time of filling should feel moist; if not moist, water should be added. Under any of the following conditions water should be added to the corn when filling the silo: First, when the corn is too ripe, and the leaves and part of the stalk are dried out to such an extent that they will not pack well. Second, when the corn is severely frozen before it has reached the proper degree of maturity, liberating the moisture and leaving the leaves and stems dry. Third, when refilling the silo late in the fall with shocked corn it is always necessary to add water.

There are two ways to add the water. First, put a hose in the silo and thoroughly saturate the dry portions, especially around the walls. Second, where the blower cutter is used, run an inch stream of water into the blower when it is at work. This will add a sufficient amount of water to insure good results.

Filling Cracks and Air Spaces in Silo.

The silo should be air tight. Any crack or space which lets in the air will cause more or less moldy silage. These troubles in wooden silos may be avoided at filling time by having a pail of soft clay at hand; as the silo is filled up, anything that looks as though it was not air tight should be filled with a handful of clay. Any cracks or openings in masonry silos should be properly fixed with cement before filling. Great care should be taken to have the door fit well and air tight. In a good silo, properly filled, there should be no waste except at the top.

Preventing Waste on Top of Silo.

There is always some waste on the top of the silo, unless feeding operations are commenced as soon as the silo is filled. The amount of waste material varies under different conditions of management from two inches where great care is exercised to ten or twelve inches where practically no precautions are taken to protect the same. Various methods for lessening the amount of waste have been tried out. One of the first precautions is to thoroughly pack and level the top of the silo. Some use oat chaff or cut straw. Others thoroughly soak the top with water, then seed with oats. The oats germinate and form a thick covering which serves to keep out the air, thus lessening the waste. One of the easiest and most satisfactory methods to pursue is to pick the ears of the last three or four loads of corn, then run the stalks through the cutter into the silo. Thoroughly tramp the same. Then put on from twenty to thirty barrels of water. This has the effect of hermetically sealing the silo, and only a very thin layer of waste will be on top.

Cost Per Ton of Filling Silo.

The cost of filling the silo (cutting the corn in the field, hauling it, putting it through the silage cutter, tramping, leveling and covering the silo) varies from 40 cents to $1 per ton. It depends on many factors. First, the distance the corn must be hauled from field to silo. Second, the kind of weather, as it will cost about 50 per cent more to fill a silo during wet and broken weather than during dry, clear weather. Third, the kind of machinery used. The cutter must be a strong, well built machine with a wide feed mouth, because at times it is put to very severe tests. The motor power must be ample; a fifteen horsepower engine is much more satisfactory than a ten where rapid filling is practiced. Fourth, a well organized crew of men will fill a silo much cheaper than where organization is lacking. The machinery should be kept going at full blast all of the time.

The following statement, furnished by a very successful dairy farmer, gives a fair idea of the cost of filling the silo: "We hire an extra man or two and make long days with the regular help during the filling season. We have our own outfit, silo cutter and engine (sixteen horse gasoline), also corn binder. We use our regular low wheel, flat rack wagons, and have two pitchers in the field, and let one of them take the herdsman's wagon for the first few loads in the morning and the last few at night.

Four teams and drivers	$16.00
Corn binder, man and team	10.00
Cutter and engine with one man	15.00
Two extra men to pitch	5.00
Two men in the silo	5.00
Thirty gallons of gasoline	3.60
Total cost per day	$54.60

"This crew will put in from eighty-five to ninety tons per day; thus it costs around 60 to 65 cents per ton to fill the silo."

The above statement is a fair one. It has cost from 60 to 75 cents per ton to fill the silos at the Iowa Experiment Station during the past eight years. The higher cost was due to hauling a long distance or to rainy weather when the loading was more difficult and the sand and dirt on the corn made it very difficult to keep the knives on the silage cutter in good working condition.

When to Open the Silo.

The corn may be used for feeding purposes as soon as the silo is filled. For the first few days it will be simply cut corn, as it is not silage until it has gone through the heating process. In a week or ten days' time the real silage will be reached. When managed in this way there is no waste on the top of the silo. If allowed to stand for several weeks there will be some waste in the form of decayed corn. This should be removed and hauled to the field in a manure spreader, as it is not always a safe feed for any class of live stock.

BERKSHIRE PRIZES.

The American Berkshire Association, Springfield, Ill., announces a number of special premiums and contests for the promotion of interest in Berkshire hogs. Some of these prize contests are unique. This association will pay $100 if the grand champion carload of hogs at the International Live Stock Exposition is Berkshires

Cream Separators, all sizes and prices. O. J. Weber Co., 225-227-229-231 East Sixth Street, Los Angeles.

or show a preponderance of Berkshire blood and will pay $50 if the reserve for grand champion is won by Berkshires or by hogs showing a preponderance of Berkshire blood.

The association is offering prizes of $15.00, $10.00 and $5.00 for the best photographs of Berkshires.

It is offering $50.00, $25.00, $15.00 and $10.00 for the best original essays on the history, characteristics and merits of the Berkshire hog, competition being limited to students of the agricultural colleges.

The association is offering $25.00, $15.00 and $10.00 for the best written advertisement to be used by the association in promoting the breed.

ANTI-CHOLERA SERUM FOR SWINE.

In view of the fact that the State Agricultural College will soon be in position to distribute anti-cholera serum we quote the following from Purdue University Agricultural Exchange Station.

Anti-cholera serum has been produced by the Purdue Experiment Station for the past three years. About 50,000 hogs have been vaccinated and treated. The results of this work have been highly satisfactory. Reports sent to this station by farmers who have used serum on their hogs show that the average loss in the infected herds treated was 9.5 per cent, and following the vaccination of the healthy herds in these infected localities, 2.25 per cent.

In neighborhoods where hog cholera infection is present, all herds in the near vicinity or on adjoining farms to the cholera herds should be vaccinated. This precaution, if taken, would prevent the spread of the disease and result in the saving of the exposed herds. Anti-hog cholera serum is chiefly a preventive agent. Because of the losses that sometimes occur in the badly infected herds that are treated and the large doses required, we refuse to furnish serum for the treatment of such herds.

As practically all of the vaccination work is done in cholera infected localities and exposed herds, it is very necessary to determine whether the exposed hogs are infected before giving them virulent cholera blood. In hog cholera, the animal is feverish several days before it stops eating or manifests marked symptoms of disease. For this reason the body temperatures of all hogs should be taken before injecting the virulent blood. If the animal has a body temperature of 104 degrees or more, serum alone in an increased dose should be used. Virulent blood should not be given when fever is present, whether it be from hog cholera or any other cause. Failure to practice the above precaution has resulted in heavy loss in a number of herds where serum has been used.

The most desirable size at which to vaccinate hogs is when they weigh from 40 to 60 pounds. At this size the dose of serum is comparatively small and the young hogs can be easily handled and rendered permanently immune. In infected localities it is sometimes necessary to vaccinate small pigs. This is frequently practiced, but it may be necessary to re-vaccinate them within a few months as the immunity is not permanent.

It is essential that the herd be given good care during and after vaccination and treatment. Hypodermic syringes appropriate for the work should be used and these should be carefully cleaned and disinfected before using. The inner sides of the thighs where the injections are made should be washed and disinfected. After vaccination the hogs should be kept out of dirty pens, manure piles and muddy wallows, in order to prevent infection of the small wound made by the hypodermic needle. The herd should be given clean, dry pens, free from dust and well bedded, and fed a light ration for a few days following the vaccination. When the abscesses form, they should receive the necessary treatment. Badly infected herds should not be treated with serum. If the infection is recent, serum may be used, but in addition the herd should receive proper treatment and care. The average cost of vaccinating hogs has been about 60 cents per head.—H. H. Madaus, Assistant in Veterinary Laboratory.

"Buy the Best Milk Producer in the world, sugar beet pulp at 50 cents per ton, of Los Alamitos Sugar factory."

Stop Using Feed For Fertilizer

Whole corn in your animals' droppings indicates that a part of the feed of even a healthy animal is wasted through non-digestion. Grinding the feed fails to save this waste, and the feeder must either let his hogs follow up the steers and eat this wasted grain or be content to realize what little he can from it as fertilizer. Saving a part of this wasted feed by *Improving Digestion* is known as "The Dr. Hess Idea," and back of it are the opinions of our ablest writers.

DR. HESS STOCK TONIC

the prescription of Dr. Hess (M. D., D. V. S.), improves digestion; it contains iron, the greatest of all blood and tissue builders, acts mildly on the kidneys, regulates the bowels, also expels worms and relieves the minor stock ailments. As proof that Dr. Hess Stock Tonic does all these things just show the formula on the label to your family physician. A poor ration well digested is better than a good ration poorly digested. Improved digestion insures more growth, more and richer milk.

Our proposition. You get of your dealer a 25 lb. pail of Dr. Hess Stock Tonic at $2.00, or 100 lbs. at $7.00 (smaller quantities at a slight advance). Use it all winter and spring. If it doesn't pay you and pay you well, get your money back. Every pound sold on this guarantee. If your dealer can't supply you, we will.

Free from the 1st to the 10th of each month—Dr. Hess (M.D., D.V.S.) will prescribe for your ailing animals. 96 page Veterinary Book free for the asking. Mention this paper and include 2c stamp.

DR. HESS & CLARK
Ashland, Ohio

DR. HESS POULTRY PAN-A-CE-A. A scientific fowl tonic, prepared by Dr. Hess to make hens lay more eggs. It acts beneficially on the digestive organs, keeps the egg organisms active, contains nitrates to drive out poisons and iron to build up the system. It fattens broilers quickly, helps chicks to maturity, cures minor fowl ailments. Very economical—a penny's worth feeds 30 fowls per day.

1½ lbs. 35c; 5 lbs. 85c; 12 lbs. $1.75; 25 lb. pail $3.50.

Small Fruits and Vegetables

THIS MONTH.

By O. M. Morris.

This month brings us to the time of the second busiest garden season of the year, as this is the proper time to plant most all classes of vegetables and many of the flowers.

In the list of vegetables we would suggest large plantings of cabbage, cauliflower, lettuce, carrots, beets, kale, Brussels sprouts, endive, cress, kohl-rabi, onions, parsley, radish, spinach and turnips, and most of the herbs. By planting the above now, cabbage (early), cauliflower, kale, Brussels sprouts, kohl-rabi and onions would be ready for use from November 1st to February 1st. The endive, spinach, parsley, turnips, cress and lettuce would be ready in two and one-half months and radish, early varieties, in thirty days, and winter varieties such as Mikado, Chinese Winter and Long Japanese would be at best in about two months. One advantage by planting now one can grow a crop of vegetables with less water and labor than at any time of the year.

The varieties most popular with our market men are about as follows: in cabbage, Winningstadt, Cannon Ball and Danish Ball Head are far in the lead, the former has small pointed heads, while the latter have round heads, and for private use are the best by long odds. One grower here says he cut over sixteen tons of Cannon Ball to the acre. Every one has a perfect head, and sold in Pasadena market at a good premium over the Winningstadt and product was very much heavier.

Cauliflower, the California Pearl, a local variety, is quite popular, but the Dry Weather, a new variety from Denmark, is proving very satisfactory; the Snowball is popular as a small very early sort, but its size is against it.

Carrot, Oxheart and Chatenay are the leading sorts, the former a little the earlier and most popular.

In lettuce, the Iceberg up to this date has held the market, but from now on through the winter, "The Los Angeles Market" strain of New York is practically the whole thing, but Wonderful is also used by many. These are all curly cabbage heading varieties.

The most popular beet is Crosby's Egyptian, but many growers prefer Eclipse for late fall planting as it makes a better or heavier top and is better protected.

The new variety of turnip, Early Snowball and Golden Ball, are very popular six or eight weeks varieties, are very sweet, round and fine flavor, but many still prefer the Purple Tops which are always good producers.

Prickly seeded Winter Spinach is about the only one used from now on till warm weather.

In onions there is no one variety that takes much precedence over the other, unless it may be the Bermudas (Red, White or Crystal Wax) which do extremely well through the winter, but any or most of the Spanish onions also do well and mature early, are sweet and fine flavored. For bunching onions or those used in small green state, any of the small early Spanish onions are good for this purpose.

In localities that are warm and in well drained soil, beans can be planted for thirty days yet. The Refugee, Stringless Green and Canadian Wonders are the best for planting after this date. These varieties will be ready for use in fifty to sixty-five days and can be held on vines for some time.

HOME GROWN BEANS.

Have you ever noticed the difference in the taste of Lima beans cooked soon after being picked from the vines and those that have stood over night or longer? After we moved to the city I could not reconcile myself to the difference in the taste of my favorite bean, and looked over my limited garden space to see what could be done. There being barely room enough for a bed of lettuce and onions, some radishes and a few tomato plants, it did not seem wise to devote all that space to beans and deny ourselves the other things.

Then I had an "inspiration." Why not plant Lima beans where morning glory and other vines had been trained over the wash house, back porch, windows and fence for shade and to cover unsightly objects? For bean vines are just as graceful and as pretty as other vines.

So the soil was prepared and the beans planted, to the amusement of the family. And the beans grew, not in a single night, as did "Jack's" beanstalk, but they flourished beyond all expectation.

I gathered from one to three quarts at a time, and had beans until frost killed them. Though the family never failed to be amused when I started out with basket and stepladder (for the vines grew to the top of the wash house and kitchen), they enjoyed the flavor of the freshly picked beans as much as I did.—C. S. P., in Ladies' World.

PARSNIPS.

The parsnip is a biennial, a native of Europe, and is cultivated for its long succulent root. It is grown in much the same manner as the carrot, although the soil should be, if anything, in moister and better condition. If manure is applied, it should be thoroughly rotted, otherwise surface roots are apt to be formed. It is a deeper rooted plant, consequently the land should be fine and mellow, and loose to a depth of twelve to fourteen inches, so that the roots can easily penetrate the soil.

The seed should be sown as early in the spring as the land can be worked. It is well to sow rather thickly, as parsnip seed germinates slowly and quite a percentage of it may not come up. Radishes may be sown with it to mark the rows, so that cultivation may follow shortly after planting. Parsnips should be planted in rows twenty to thirty-six inches apart, depending on whether they are to be cultivated by hand tools or by horsepower. If very thick, the plants should be thinned to two or three inches apart in the row.—Minnesota Farmers' Library.

KALE.

Kale is one of the members of the cabbage family, little grown in this section. It is desirable to grow for greens to use during the late fall. It will stand considerable frost, and some varieties are even used after snow falls in autumn. Sow where it is to remain in the garden.—Minnesota Farmers' Library.

White Lead on the Farm—*Vehicles*

You can't afford to neglect painting your farm wagons. A few small cracks will let in the weather, the wood will begin to rot, the timber to weaken, and a break-down will follow. *Neglect ruins more wagons than over-weighting.*

Good old-fashioned paint made of

"Dutch Boy Painter"
Pure White Lead

and pure linseed oil is what wagons need. It holds to the wood like a nail and fills every crack and crevice. The surface of the wood is protected against moisture until the paint is actually worn away.

Our Free Painting Helps. We will send you free on request color schemes and miscellaneous painting instructions. Ask for Helps No. 2826

The Ornamental Garden

THIS MONTH.

By O. M. Morris.

The Dutch bulbs are arriving and this of course is the principal item of work for the next sixty days; all such bulbs will be the better for early planting as soon as one can get them in. Any one not fully acquainted with such bulbs should post themselves by getting the seedsmen's catalogues with cultural directions, not that they are hard to handle but for the best results, especially in certain species, as hyacinths, they require special treatment.

Seed of all the hardy annuals should now be planted, such as snapdragons, delphiniums, stocks, pansies, poppies, calliopsis, godetias, lobelias, lupines, mimulus, phlox, centaureas, corn flowers, calendulas, clarkias, cosmos, gaillardias, gilia, gypsophilas, forgetmenots, mignonettes, scabiosas, nasturtiums, zinnias and all such hardy plants and by carefully arranging such, one can have a quantity of cut flowers all winter.

Sweet peas, the winter flowering varieties, should be in the ground during the next thirty days for good large healthy growth and flowers for Christmas. This is a special strain of winter flowering varieties and are the only kind for planting now. The grandifloras and orchid flowering varieties planted now will not bloom until next spring, so it is necessary to get the "winter flowering" varieties if you want winter flowers.

Many of the perennial flower seed planted now will bloom in early spring, as coreopsis, delphinium, hollyhocks, aquilegias, cyclamens, digitalis, petunias, verbenas and such class of flowers. These are best planted in small beds and during early spring plant out where they are to grow.

It would be impossible in an article of this nature to mention anything like a full list that can be planted, but have merely mentioned some sorts that one can form an idea of what to do.

THE PLANTING OF PORCHES.

A branch of the business that is too much overlooked is the adornment of porches, especially those with a sunny exposure. Some very beautiful effects can be brought out by proper planting and care. The porches where the sun beats down during the middle of the day or in the afternoon need vines that will give them a shade, and there are many of these that rapidly cover the porch and when in bloom add greatly to the decoration of the residence.

It is not necessary to be confined to one species of plant for these locations, for with a good sized porch, plants that will bloom in spring and fall can be planted at proper distances and thereby make this an interesting feature. The wistaria has always been popular, and when it is full of its lovely hanging blue blossoms in early spring is always a great attraction and a beautiful sight. The Clematis paniculata is an equally decorative plant in the fall, when it is covered with its sprays of white flowers; the other clematis are fine for this purpose, although they do not make as heavy a shade; the Jackmani, with its large purple flowers in midsummer, makes a very beautiful plant for this purpose. Roses are, of course, well known as among the best plants for this purpose, and with different varieties of the climbing roses fine effects may be produced.

Where heavier shade is desired, Aristolochia sipho is one of the finest and in two or three years from planting will cover a large area, which with its heavy foliage and hanging flowers is sure to attract attention. Another plant that is much used, and does equally well on porches on the north side, is the Ampelopsis quinquefolia, or Virginia creeper, which is also a very rapid grower after once getting established. While the flower of this plant does not amount to much, yet the foliage in the fall takes on beautiful colors, and the large clusters of purple fruits are an added feature. The proper planting of the lower part of the porch demands attention, and most of the low flowering shrubs are particularly adapted for this purpose, especially the deutzias or spireas.

There is one thing that should be always borne in mind in planting a porch with these hardy plants, and that is that they should be trained upon trellises that can be easily removed, and the plants not trained to the porch itself, for the porch must be painted, and it is almost impossible to take the big plants down and replace them in good condition, but if attached to a trellis this can be laid over while the painting is being done and replaced when the paint is dry.—Gardening.

THE BEAUTY OF ADAPTABLE SHRUBS.

Among the flowering shrubs, old-time favorites of our grandmothers, some of which have been in cultivation since the eighteenth century, are the lilac, Forsythia or golden bell, syringa, bridal wreath, wigelia, snowball, Rose of Sharon (althea) and crepe myrtle. Any of these may be grown successfully, but it is rather difficult to state in a general way just what kind of shrubs to plant. However, any reliable nurseryman will tell you what shrubs will thrive in shady places, what ones will grow in wet places, and so on.

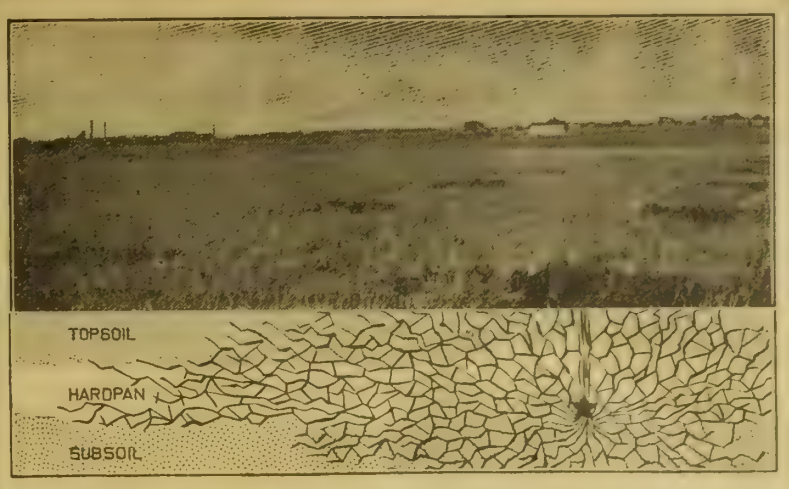
Aside from general consideration, shrubbery has its specific uses. For instance, it may be used to screen off the chicken yard, the garden, unsightly corners and other undesirable objects. With us, as a rule, shrubbery succeeds better when planted in the fall.—Farm and Ranch.

Keep the coleus and other foliage plants, used as borders, trimmed evenly. Neatness and symmetry pay in the ornamental garden.

If the lawn is weedy and the grass does not seem to make a good growth, apply nitrate of soda at the rate of 150 to 200 pounds per acre. Scatter broadcast just before watering.

The yards around the house are usually in harmony with the rest of the farm. Are yours clean and tidy?

Every farm home ought to have a telephone. The convenience will pay for itself many times over, especially in case of fire or sudden sickness.



Drouth Problem Solved

WITH

DU PONT

RED CROSS DYNAMITE

The ample rains of fall, winter and early spring may be drawn on all summer by storing them in subsoil. This is made possible by dynamiting the compact subsoil or hardpan, thus creating a water reservoir and making available fresh nitrogen, phosphorus, calcium and other fertilizing elements now useless. *October is the time to subsoil.*

Write for Free Booklet

To learn how progressive farmers are using dynamite for removing stumps and boulders, planting and cultivating fruit trees, regenerating barren soil, ditching, draining, excavating and road-making, ask for "Farming With Dynamite, No. 164"

WHY you should have

A Likfreshing Plant

BECAUSE you can easily and cheaply convert your perishable fruits and vegetables into staples.

LIKFRESHED products are superior in every way—less loss of weight and food contents—less sulphur required. Superior flavor and keeping qualities—"Just Like Fresh." Cost of installing plant is nominal. Expense of operating is less than sun drying. For other reasons and full particulars, write or call. Be sure to look into this matter this season, as it will prove a money maker for you.

CONTENTS THIS WEEK

REDWOOD GIANTS OF CALIFORNIA, Cover.

GRAVENSTEIN APPLE SHOW, 217.

CITRUS AND TROPICAL FRUITS.—Proper Pruning of the Orange Tree; Orchard Notes; Cover Crop Seed per Acre; 218.

DECIDUOUS FRUIT CULTURE.—Dynamite, Aid to Farmers; 220.

STATE FAIR, 221.

LIVE STOCK AND DAIRY.—Filling the Silo; Berkshire Prizes; Anti-Cholera Serum; 222, 223.

SMALL FRUITS AND VEGETABLES.—This Month; Home Grown Beans; Parsnips; Kale; 224.

ORNAMENTAL GARDEN.—This Month; The Planting of Porches; Beauty of Adaptable Shrubs; 225.

EDITORIAL.—Growth from Co-operation; Co-operation in France; Insecticide Analysis; Western Apples; Tribute for Excellent Work; Cholera Vaccine; Persistent Little Cuss; 226.

AGRICULTURAL NEWS NOTES OF THE PACIFIC COAST.—Northern, Central, Southern, The Coast, 227.

PROFIT IN THE POULTRY YARD.—Notes for the Squab Raiser; Hen Talk; Poultry Hints; Feathers; Limberneck; Save Your Poultry Manure; 228, 229.

VETERINARY.—Lameness; Anemia; 230.

QUERIES.—Covering Irrigation Furrows; Drying Prunes; Cost of Line Fence; Lady Birds; The Dasheen; Fertilizing Valencias; Alfalfa on Damp Land; Snails in Spring; 231, 233.

HOUSEHOLD.—The Horse, the Dog and the Man; The Unexpected Challenge; Remedies for Skin Troubles; Remove Iron Rust; Prolong the Life of the Broom; 234, 235.

PRODUCE MARKET.—Los Angeles Market; San Francisco Market; Deciuous Market; Citrus Market; 236, 237.

GROWTH FROM CO-OPERATION.

Democracy without the altruistic spirit—the spirit which considers first the general good—is a farce. The co-operative organizations which are now becoming so popular among farmers are essentially altruistic. Therein they make for democracy. The extension of co-operation means the yoking of all the forces of science and invention—which an overintense individualism has heretofore allowed to minister chiefly to the advancement of private fortunes—to the advancement of the communal welfare. Co-operation makes it no longer essential to the best economic use of either land, machinery or capital that the ownership of large areas shall be concentrated in the hands of individuals. It makes small land holdings compatible with the largest agricultural undertakings. In carrying on any public enterprise, or introducing any public betterment, the combined resources of many men of small means can usually accomplish anything possible to the multimillionaires, and accomplish it in such a way as to make the undertaking helpful in the manner of its doing as well as in its results. Growth comes rapidly to a community where many men are thinking for the general good—and just as rapidly to the individual who thus makes it manifest that he is touched with the divine spirit of altruism.—C. R. Barns.

CO-OPERATION IN FRANCE.

In the bulletin of the Bureau of Economic and Social Intelligence published by the International Institute of Agriculture at Rome, attention is called to the magnificent progress co-operative agricultural associations have made in France during the past 25 years. The number in successful operation is 5,200. Their scope is the bringing together of business and productive interests, and in addition buying and selling for their particular calling. There are over 10,000 mutual insurance societies in that country. The greater part of the co-operative marketing organizations have to do with dairies, factories and small fruit places. The law was passed in 1906 which grants to co-operative societies loans for 25 years at an interest not exceeding two per cent. Loans may be made to each society to the extent of twice its fully paid capital.

INSECTICIDE ANALYSIS.

Writing as to the large number of requests which come to the State University for analyses of cyanide, Prof. Woodworth says that many who are sending these samples do not seem to understand the provisions of the insecticide law. To reach many of these he requests us to announce:

Analyses are made for users of insecticides and fungicides for the nominal fee of $1.00 per sample. In the case of cyanides, if the quantity of cyanogen and chlorine alone are desired the report can be made within twenty-four hours. If a determination of potassium and sodium, forty-eight hours will be required. In cases of sulphuric acid the report can usually be made within twenty-four hours.

The fee should accompany the sample in order that there shall be no delay.

In all cases the registration number should accompany the sample so that we can identify the goods.

No insecticides are salable until registered, and all packages must bear the registration number.

The shipping season for the 1911 crop of almonds was opened on August 24th by the California Almond Growers Exchange. The order was from San Francisco and was for Nonpareils. Manager Dargitz of the Exchange thinks the season will prove a most profitable one to almond growers.

WESTERN APPLES.

Speaking of apples in Pennsylvania a contributor to the Country Gentleman says:

"We cannot pass through a town of any size in the East without seeing the fruit and grocery stores making a conspicuous display of western-grown apples. This has become so general that consumers have naturally come to believe that choice highly-colored fruit is produced only in the West. We cannot blame them very much, as the eastern growers have done but little so far to undeceive the consumer, while the West is persistently making itself solid with the apple-eating public. There are two good reasons for the popularity of western apples. They are packed attractively in a convenient-size box, and the buyer can depend upon their uniformity and fine appearance."

Plainly the West has established a reputation for a fairly good pack, but we need to improve on our reputation for it must be realized that in the quotation given above we are held up as an example rather than to criticise us, consequently we do not know all that the same writer could have said against our pack as well as in its favor. Sure it is an attractive pack means much in favor of apples or any other fruit consumed. In the same article, referring to the attractive pack and attractive way in which apples were displayed in large department stores, the writer says:

"Often the largest profit in fruit-growing is the easiest and most inexpensive to obtain, and the grower who spends a little extra time in putting up an attractive package and wrapping the fruit in paper is rewarded beyond all proportion to the expense.

"Some wag has remarked that apples turn red in the fall because they blush to think they have been green all summer, and if our eastern growers were half as sensitive as their fruit, they would soon realize their wonderful opportunities and show the western invaders that the home-grown apple is indeed the king of fruits and quite able to hold its own."

TRIBUTE FOR EXCELLENT WORK.

The first tree warden to be appointed in the state of California was James H. Reed of Riverside. He has made that city noted for the beauty of its streets through years of persistent labor, often having to work against the wishes of many others, but today Riverside boasts of some of the most beautiful driveways in the world. We regret very much that failing strength has compelled Mr. Reed to drop his work and tender his resignation. In tribute to him the Riverside Press says:

"It is to be regretted that he feels that he must lay down the burdens of the work which he has carried so long and so well; and the best monument which he leaves is the miles of well shaded streets, which were bare and unattractive when he began his campaign for tree planting. That monument ought to be carefully cherished and protected, for it is one of the great assets of the city, and Mr. Reed's resignation ought not to be allowed to check the progress of the work which has been so close to his heart. What he has done should be protected and perpetuated and the city should go on to even greater and better things."

CHOLERA VACCINE.

Dr. Haring of the Agricultural College informs us that the State University will be able to extend aid to the live stock industry through the appropriation made by the last legislature granting to the University a special fund for agricultural experimentation. One of the first steps taken will be manufacture of hog cholera serum. It is expected that it will be supplied either at cost or for a nominal sum to stock growers of the state. With it will be given fullest instructions for use. It will be some time before the arrangements can all be completed, but the Cultivator will make announcement as soon as the University has the material ready.

A PERSISTENT LITTLE CUSS.

On August 11, 1910, the Cultivator gave in its poultry department an article on fowl ticks. The article was brought out by an inquirer sending in specimens of the ticks infesting his chicken house and asking what to do to eradicate them. We took time to secure engravings also information from Prof. Baker of Claremont which appeared in the issue of August 10th, so the specimens of ticks were received in this office prior to the first of August. Now, the first of September, more than a year later the little container in which two of the pests were stored is examined, and one of the ticks is alive and apparently reasonably healthy. His thirteen months' fast has put him in good condition for a meal.

This gives something of an indication of the problem which confronts the poultryman who would eradicate ticks from his poultry houses. This is not the place to give an extended article on this pest, but we refer to it more to call attention to some of the persistent little wretches with which the farmer has to deal. As the old lady said of Satan, "There is one good point we can admire in him—he is persistent." We have occasion to admire very greatly the perseverance of some of the pests, and unless we have occasion for equal admiration for the farmer's, he is reasonably sure to go down in the unequal contest. But with the scientific methods which are perfected in these days and the same persistence which these ticks show, they may be overcome.

The Council of Grain Exchanges is following up a persistent and, we may say consistent, course of education in a series of circular letters to rural papers. It is the endeavor to convince agricultural editors that "The grain exchange is a necessary institution and that speculation is absolutely essential to the conduct of a grain business." "Speculation reduces fluctuation in grain prices to the minimum." It may be that the exchange will succeed in its campaign in converting some, but we doubt not many hard-headed farmers will continue to ask wherein boosting and bearing the grain market to make or break certain speculators can have any beneficial effect on legitimate production and marketing.

The American Guernsey Cattle Club is offering cups which will be awarded at a series of fairs largely over the eastern part of the United States. The cups are facsimiles of an Island of Guernsey milk can, a novel proposition and yet one which will doubtless be prized by Guernsey breeders. In addition to this cup, special cash prizes are offered. We see no offering for California's state fair or other Coast exhibition, and it is possible the Guernseys are not yet plentiful enough to make a showing which would justify the organization in presenting them, but pure bred cattle are winning greater place in the state, and the association which would preempt the ground should get busy to encourage its breed in every possible way.

The 1911 session of the Farmers International Congress will be held at Columbus, Ohio, the week beginning October 12. The Secretary of the Congress is George M. Whitaker.

Agricultural News Notes of the Pacific Coast

Northern California

Picking hops in Sonoma County begins this week.

Siskiyou County is planning to bond itself for better roads.

Nevada County is harvesting a fine bunch of harvest pears.

Marysville's prune crop is not up to the average in quantity.

Marysville seedless grapes are being shipped East in car lots.

Santa Rosa Grange held a meeting last week with good attendance.

Arbuckle, Colusa County, is establishing a reputation for fine Tokay grapes.

Wild ducks are proving very destructive in the rice fields near Biggs, Butte County.

The Bartlett pear crop of Nevada County is being harvested. The growers expect large profits.

About twenty-five per cent greater than any past year is the estimate of Butte County's olive crop.

Newcastle, Placer County, claims the shipment already of over 500 cars of deciduous fresh fruits.

The Southern Pacific will construct a fine park around its buildings at Los Molinos, Tehama County.

The culture of rice is being successfully carried on in Colusa County this year on land before given up to pasturage.

The Sacramento Valley Irrigation Co. has 700 men and over 1000 mules in its various grading and construction camps.

The fruit growers of Butte County are disposing of their green fruit this year, drying only what is too ripe, as they find the green crop pays better.

The pest of army worms in Sisson, Siskiyou County, has turned to an annoying pest of butterflies. They are said to be so thick that they stopped a game of baseball.

The olive industry is growing more popular in Butte County. Prices this year are better than ever, many growers claiming that they give better profits than oranges.

Oroville, Butte County, has promise of the biggest citrus crop that section has ever known. The increase is said to be due to better care having been given to the orchards during the past year.

The great siphon which will carry water to the Sacramento Valley's irrigation ditch under the track of the Southern Pacific, Willows, Glenn County, will be completed in about three months.

The Eel River Valley Apple Growers Association has appointed a committee to gather data regarding the construction of an apple dryer. The headquarters of the association are at Rohnerville, Humboldt County.

A village farm plan is to be inaugurated at Los Molinos, Tehama County. All the farmers will reside in the center of the colony, and the farms will surround the town in all directions.

The State River Board has recommended that Star Bend on Feather River be cut, if property owners will provide right of way and pay half the cost of construction. The state engineer has estimated the cost of the work at between $60,000 and $70,000.

Central California

Fresno County Fair will be held October 3-7.

Muscat raisins are being sold at 4½ cents at Fresno.

Kerman, Fresno County, will hold a farmers institute September 27-28.

Peach growers are refusing to sell dried fruit at less than 10 to 10⅛.

Lodi grape men have fixed upon $11 as the minimum price of wine grapes.

Tulare County prune orchardists have been compelled to prop their prune trees.

The greater portion of the Malagas have already been shipped to Eastern markets.

The Merchants Association at Lindsay, Tulare County, held its first fruit market day on August 30.

Greek laborers are being used largely in the gathering of the grape crop of the San Joaquin Valley.

Kern County boosters claim that over 260,000 acres of land in that county are in the citrus belt.

The next meeting of the Citrus Chamber of Commerce at Porterville will discuss methods of fertilization.

Requests have been coming in to Mayor Davison of San Jose for white families to go out into the prune orchards.

Tulare County has sent its last honey to the Eastern market, the bee keepers association of that county forwarding about ten cars.

Japanese labor contractors around Fresno are making contracts for raisin picking at about one cent per tray above last year's price.

Agitation still continues regarding the formation of the raisin growers into an organization similar to the citrus fruit growers exchange.

Several of the larger raisin buyers of Fresno have threatened to call in all their buyers because of the big prices demanded by the growers.

Fresno fruit shippers have secured lower express rates, which will permit the handling of small shipments of oranges on a more profitable basis.

The country about Clovis, Fresno County, has sent out shipments of green deciduous fruits amounting to over one hundred cars so far this season.

Turlock recently held a great watermelon eating contest. A $50 prize was given to the one eating the 20-pound melon in the shortest time. It is said Charlie Chambers was referee.

Fresno reports word from the Remsen Board that a permit will be issued for sulphuring dried fruits on the basis fixed by Germany. This is generally acceptable to the fruit growers.

Squirrel Inspector Zimmerman of Tulare County reports a shipment of seven tons of poisoned barley to the White River and Hot Springs districts by the Southern Pacific. The poison is to be furnished free to renters of railroad land.

At a meeting of the Santa Clara Grape Growers Association last week prices for grapes for the 1911 crop were fixed at $18 for ordinary wine grapes, with finer grades running as high as $24. It is estimated that the year's output will be 25 per cent greater than last year.

Southern California

Test wells are being sunk near Hemet, Riverside County.

A new creamery will be established at Perris, Riverside County.

San Bernardino is planning for a farmers institute to last several days.

Turkey raising is still proving remarkably profitable in the Imperial Valley.

Another large packing house is to be built at Ontario, San Bernardino County.

The San Diego County horticultural commissioner reports purple scale increasing.

The Coachella Valley promises to install a gin which will handle long staple cotton.

Pomona Cannery, in eastern Los Angeles County, is handling 4000 boxes of peaches daily.

The Rancho Verde Company at Victorville, San Bernardino County, shipped five cars of fat steers last week.

The water system supplying Rochester, San Bernardino County, will be increased by the purchase of new supplies.

The pear crop at Little Rock, Antelope Valley, Los Angeles County, is reported as somewhat smaller than last year, but of exceptionally fine quality.

Imperial County has a shortage of cotton pickers, but all laborers who can be pressed into the work are beginning on the season's pick.

A brush fire in San Dimas Canyon, Los Angeles County, called out many fire fighters and it was brought under control when about 650 acres had been burned.

Escondido is holding a county fair this week and Saturday will be special grape day, when the promise is made that ten tons of her matchless grapes will be distributed free.

Imperial County, the youngest county in the state and but ten years ago known as the Colorado Desert, claims to rank fifteenth in the amount of business transacted in its county offices.

The Farmers Warehouse Company, operating at Huntington Beach, Orange County, is busy rolling barley and cleaning beans. The plant has up to date machinery and a big working capacity.

Engineers have inspected the Alamo channel of the Imperial Valley irrigation district and it has been found that the bottom of the canal is higher than the sill of the intake gate, but this is said to be an indication of better conditions than a year ago.

Corona, Riverside County, bee keepers have pooled their interests and a car of water white honey is being loaded for shipment to Germany. There are 250 cases in the shipment. It is said the shipment will bring to the growers 17 cents per pound.

The Fillmore Herald states that one morning last week saw fourteen wagonloads of apricot pits standing to have their loads weighed. Each wagon contained from one to three tons of pits. The pits are cracked and the kernels shipped to Germany, and some of them may be returned to us in the shape of "almond meal" and other "almond" preparations.

The Coast

Arizona is greatly stirred over the coming election on statehood.

Tacoma hop growers predict that a 50 cent price will yet be reached.

Harvesters near Pullman, Washington, were greatly injured by heavy rains out of season.

The Colorado potato growing sections report about 60 per cent of a normal crop for 1911.

Rogue River Valley pear growers are picking fruit in a half hearted way, owing to the low market.

Kermit Roosevelt killed several mountain sheep in his recent hunting trip in Lower California.

The Hood River apple growing section will have a crop this year of only about fifty per cent that of last year.

From the present outlook the hop harvest of Washington County, Oregon, will about equal that of last year.

The Siskiyou Electric Power and Light Company has control of great water power and irrigation possibilities near Medford, Oregon.

Meat packers at Portland, Oregon, are bearing the price of cattle and it is rumored the farmers are in arms and will seek other markets.

For the purpose of determining the action of cover crops an association of fruit growers of Hood River, Oregon, will conduct four experiment stations.

Hop picking will begin in Lane County, Oregon, the first of September. The condition of the crop is exceptionally good and free from insects and other pests.

A few weeks ago fears were entertained that drouth would greatly injure the hop crop near Tacoma, Washington, but a copious rain has saved the day.

Boise, Idaho, plans a week's carnival, beginning October 9, in honor of the progress of the country since the coming of irrigation. There will be large agricultural exhibits.

Farmers at Goldendale, Washington, are experimenting in endeavor to find the best crop to rotate with wheat which they find is exhausting the soil from continuous one-crop culture.

A representative of the Choctaw tribe near Spokane, Washington, is taking steps to have restored to various Indian tribes of the Northwest $10,000,000 to $15,000,000 for lands taken from them wrongfully.

Eastern capital has been interested in installing an irrigation plant for a large tract of land near Ontario, Oregon. The water will be raised to the foothill section by three lifts, one of fifty, one of eighty, and one of 100 feet.

Eleven thousand acres of land in Klamath County has been restored to the public domain after having been withdrawn for reclamation purposes. The land has been determined too high to be reached by the government irrigation canals.

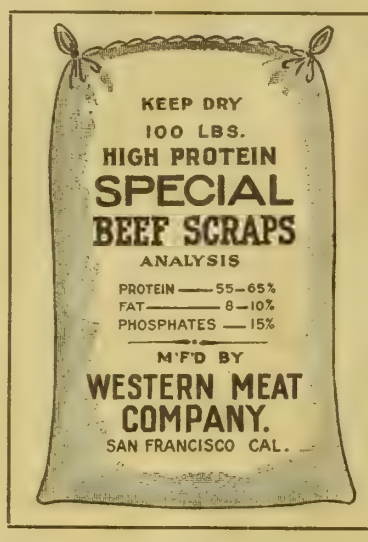
The Spokane Apple Show management offers $20,000 in premiums for its coming show. There will be a series of growers conventions and country life meetings. In addition to the $20,000 premiums $15,000 will be spent in pageants and other features connected with the celebration.

Animal Matter a Necessity For Poultry

Experiments at various State Experiment Stations have demonstrated beyond a doubt that Protein derived from an animal source is far superior, as an egg producer and flesh builder, to Protein derived from a vegetable source.

Our High Protein "Special" Beef Scraps Will Supply That Necessity

If your dealer cannot supply you, write us, and we will send you samples and price.



Made in California from fresh Packing House Products. Look for the word "Special" in red ink on every sack.

Western Meat Co., San Francisco, Cal.

Dried Milk for Fowls

Nothing better, especially in hot season; nearly 50% protein. Special prices for short time only:

Harding's, $3.50
Casein Co.'s, $3.50
Bent's, $3.75

5 Sacks 15c and 10 sacks 25c less

326-328-330 S. Main St., Los Angeles, Cal.

When writing advertisers, mention Cultivator.

Profit in the Poultry Yard

Practical poultry people who may have ideas from their experience as to methods of feeding and housing and general care of poultry will confer a favor upon the Cultivator and its circle of readers by sending in concise accounts. Mrs. Basley is always willing to answer queries, which with the experience of others should make this a most valuable feature in poultry life on the Coast. Opinions or matters of a personal nature should be omitted, but a concise statement of facts is always valuable.

NOTES FOR THE SQUAB-RAISER.

In order that it can be taken out and cleaned, the floor of each nest should be movable.

Sawdust should not be used in the nest, as it harbors lice.

Never add new birds to a flock already started if you can possibly help it.

After seven or eight years' breeding, the usefulness of the bird is ended.

For want of the proper experience the first year the parent stock are apt to be more or less careless and neglectful.

After giving the feed, it is best to leave the loft, as pigeons are apt to forget their young if they are watched while feeding.

It is estimated that a pigeon of the average size will need an ounce of food a day, together with plenty of grit, salt and fresh water.

Where a loss of appetite and indisposition of the bird is noticed, a good remedy is to feed a little hempseed, add precipitated chalk to the drinking water, and keep a good supply of grit within reach. It will help greatly if the bird is isolated for a day or so.

Squabs cannot see until about eight days old.

A good weight for dressed squab is eight pounds to the dozen.

The eggs hatch on the eighteenth day of incubation.

In stocking the loft, allow two nests for each pair of breeders.

As a rule the breeding season extends from March until September.

The first egg is generally laid about two weeks after the nest is made.

The market price for dressed squabs is best during January, February and March.

The Homer is a strong, well built bird of good size, thrives in confinement, is an earnest breeder and a careful feeder.

The Runt is the largest of the pigeon family, but is a slow breeder.

Never feed new grain; it is apt to cause bowel trouble.

Rye is a grain that should never be fed, as it is very laxative and liable to cause severe intestinal irritation and death.

Hempseed should never be fed liberally, as it is very heating and fattening.

An overcrowded loft is both unprofitable and a danger.

When the young birds are about two weeks old, the wing and tail feathers generally start growing. The small feathers follow these.

The old birds quit feeding their young as soon as they hatch out a new pair of squabs.

It is a mistake to build the house directly on the ground. Such lofts are generally damp, and, besides, are difficult to keep ratproof.

There should be no cross pieces in the middle of the fly, as birds are often injured by flying against them in a sudden fright.

The small, round louse, found on the body and head, is the most troublesome.

Before placing new stock in the loft, it should be quarantined for a week or so.

Being very fattening, millet-seed must be very carefully fed.

Be sure to sift the cracked corn before feeding.

Pigeons are great water-drinkers, especially while caring for their young.

Do not stock the loft with "cheap" birds. In buying, the price should be governed by quality.

Large squabs are produced by large-sized breeders.

Success follows experience.

A mating should never be broken as long as satisfactory work is being done.

Fresh water should be given twice daily, but only the very best of grain. Avoid damaged stuff.

Do not fail to bear in mind that the profit is derived only from mated pairs.

HEN TALK.

The loss of young chicks is very great through the country each season, and while it may seem to be a different disease each year, from the most prominent symptoms, I think two causes may be blamed for all the loss.

Lice and lack of vigor. Which of these two is more to blame I can hardly say, and when both combined attack or are in the same flock there is little chance of rearing a profitable per cent. The lice we can and must fight along day by day; the lack of vigor must be looked into this fall before selecting the flock for next season's hatching eggs.

Nothing but vigorous parent stock will produce eggs that hatch chicks worth the bother of rearing, and while there will be some puny chicks from the most vigorous flock, they will be a small minority.

Disease, filth, lice and inbreeding, all or any, cause lack of vigor among the breeding stock. Starved or over fat breeders will not produce strong hatching eggs.

If you are convinced the breeders are off, either procure new parent stock for eggs or procure eggs from a vigorous flock for incubating. It is much better to be late in hatching chicks than to have earlier chicks that are weakly.

A strong chick a month the younger will go ahead of the month older chick before fall comes, and will be of some good when it is grown.

Don't ever keep the weakly chicks for either winter layers or to place in the breeding pen. They will lay few if any more eggs than will pay for their board bill, will six times out of ten hatch weak chicks, and they are always grabbing at chances to take cold, roup, or to go under from the least offness in their feed. In short, they are weaklings from start to finish.

Inbreeding for the sake of fine feathers and appearance will ruin the best flock if persisted in a few years, and as we cannot always know how recently some of the flock have suffered from this, procure cockerels this fall that you know are in no way related, or, better, purchase a setting or so of good eggs, and carefully cull out all but the very best cockerels. Don't keep any of the pullets either, unless they can be penned to themselves.

If this rule is adhered to strictly,

the weakness from inbreeding will never bother, and the lice and disease won't bother if right conditions are carefully practiced.

Lack of vigor is the one really great bugaboo in rearing chicks. Vigorous flocks belong to the one that has such "fine luck" with chicks.—Indiana Farmer.

POULTRY HINTS.

No one farm is large enough for more than one variety of fowls.

Impure water will not produce many eggs of any kind, and none that are good.

The average farmer who grows large crops of grain on his farm is the poorest feeder.

Coarse sand and gravel will reduce the amount of grit needed by the fowls, but cannot take its place.

Push the pullets along to rapid maturity.

Study the wants of each customer, and plan to meet them.

Fewer and better birds, and all as much alike as possible should be every poultry keeper's motto.

Keep a close watch for the most thrifty, and earliest-maturing pullets, and mark them for your next year's breeding pens.

The feeding problem is greatly simplified if females of about the same age are kept together. What is an ideal ration for old hens may be entirely wrong for pullets. Separate them so as to obtain approximate results while feeding.

Don't stop feeding your chickens because they are on range. Feed them all they will eat hungrily, and let them have the grasshoppers and other bugs as extras. Of course they could live altogether on the range, but if you feed them too, they will mature much more rapidly. The pullets will be laying earlier, and the young cockerels will be ready to sell sooner.

The poultry must have plenty of water these warm days. A thirsty hen will lay no eggs, and chicks deprived of water will get sick.

Milk is fine to feed the hens. It supplies the albumen which is such a great part of the egg.

Bread, soaked in milk, and then squeezed dry, is excellent to feed young chickens and ducklings.

Poultry, running in the orchard and fields, is a great help to the farmer in his work of destroying harmful insects. By all means keep as much poultry in the orchard as you can.

When selling your surplus stock, don't forget that you will want some yourself for table use.

FEATHERS.

Don't pen up ducklings and goslings in the hot sun. Be sure they have plenty of shade and water, and green stuff to eat.

It is too late now to hatch pullets for early winter layers, but if hatched now and given the right care they will begin laying in January and February and make good summer and fall layers. The early hatched pullets cannot lay all the fall and winter and through the next summer, so, if you have room for them, hatch some pullets now to keep the egg basket filled while the earlier flocks are resting or setting next summer.

If you are not willing to do the work necessary to keep your poultry free from lice, don't try to raise it. It will not pay you.

Don't pen up ducklings and goslings in the hot sun. Be sure they have plenty of shade and water, and green stuff to eat.

LIMBERNECK.

In answer to an inquiry for a remedy for limberneck, would say that this disease is an affliction that is usually caused by fowls eating diseased meat full of maggots. Some say it is also a result of ptomaine poisoning. The remedy is turpentine, and the following is a good treatment: Mix a tablesponful of turpentine in an equal amount of warm water and pour into the crop. Follow by filling the crop with warm water, and then, holding the fowl by the feet, gently work out the entire contents of the crop. When thoroughly cleaned, give a tablespoonful of castor oil, and allow the fowl to remain quiet by itself until recovered. Of course it is obvious that unless the source of the trouble is removed the fowls will still eat the diseased meat and become ill again, therefore a careful inspection of the surroundings should be made to see that no dead and decaying animals are lying around as a breeding place for maggots.—Kansas Farm.

PERCHES FOR YOUNG STOCK.

Authorities do not all agree whether a chicken should be allowed to perch early in life or be compelled to squat on the ground. One writer says Nature is a very reliable guide. When the wing feathers have sufficiently developed to allow the bird to use them, then perching is at once indicated. That no doubt is true, but on the other hand if birds perch while very young the breast bone, which is little more than gristle, is easily bent. But after it has taken on its more firm, bone-like condition it requires considerable pressure to bend it. In the young bird the crookedness is not caused by a break, but rather by pressure or the shape moulded. This is generally brought about by a small, round roost, the breast bone being brought down on the keen edge, and the pressure caused by the head counterbalancing the tail thus gradually forcing the bone out of its keel shape, and the indentation becomes permanent as the bone hardens.

This is especially so with chickens from inbred stock. The writer has a different method for this perching, using low, wide perches, so the chickens must squat, and thus the breast bone is protected by the legs, which will not permit it to come in contact with the perch. The practice of allowing fowls to squat on the floor is not advisable, for the reason that the floor is generally cold, and there is always more or less current of air moving close to the ground, which is apt to chill the stock.

No turkeys should be allowed to perch before they are fully three months old; four months would be better. Even when it is a case of weight for weight, a nice straight-breasted bird with the flesh laid evenly alongside it has the appearance, if not the actual fact, of carrying more meat, and no one can deny the fact that it is much easier to carve.

Diarrhoea in chickens may be caused by various things, too cold or damp weather, as a rule produces such symptoms or too low temperature in the egg chamber during incubation will produce a similar effect. The best treatment for such a condition is to keep the chicks warm and dry and feed boiled rice on which has been sprinkled a little cinnamon. Give them lime water to drink and plenty of charcoal.—J. C. Clipp.

SAVE YOUR POULTRY MANURE.

I have several queries about hen droppings. One reader wants to know whether they can be applied advantageously to growing crops. Surely they can, and often they give big returns. Save it, every bit of it, and save it carefully. A little superphosphate strewed over the accumulations under the roosts, or over the heaps under shelter anywhere, will save the ammonia in it and make it all the more effective. If you have no superphosphate on hand, use dry muck or loam instead. Mix it well and have it as fine as possible. Whenever you notice that one of your garden crops is in need of a little extra stimulation, put a quantity of the hen droppings, held in reserve for this purpose, around the plants or on both sides of the row, and afterward work it in with cultivator and hoe. In this way I often help my Lima beans, egg plants, peppers, tomatoes, cucumber, melon and squash vines along at a wonderful rate, and produce big yields.

I now have several barrels of hen droppings on hand that are intended for celery. A lot of this is added to the old well rotted stable manure which is filled in the furrows at the time these are prepared for setting celery plants. The manure is well mixed with the soil, the furrow filled in nearly level with the surrounding ground, and the plants, in single or double row, set along right where these manures will do them the most good. Some celery growers apply from one to two tons of high grade fertilizer per acre (an expense of forty to eighty dollars). With the free but discreet use of hen droppings you can raise just as good crops.—Farm and Fireside.

Filth of all kinds causes lice. The mites will breed in the droppings. Rotten nest eggs are good sources. The heat from the body of the hen hatches them by thousands. Every crack and crevice contains them. Look on the birds to find the large body lice, as they never leave the fowls. Rub a little melted lard on the head and neck of the birds, and dust the bodies well with insect powder. There is, however, no use in wasting time doctoring the birds unless the premises are thoroughly cleaned and kept clean and sanitary.

Lard and vaseline, equal parts, make a good remedy for lice on the head of the chicks. Vaseline, three parts, and kerosene, one part, is another excellent mixture. Rub it well into the down in the vicinity of the wings and on the neck. One or two applications will entirely overcome the pests.—Dr. Wallace.

PEERLESS IRON WORKS

125-127 O St. Sacramento, Cal.

Veterinary

Answers in this column by Fred G. Matthews, M. S., D. V. M., 1232 Central Ave., Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Lameness.

My horse is lame in the right front foot. At first he would be lame at times, but lately he is lame all the time, and appears stiff in front, similar to a horse that has been foundered. When traveling the feet are glided along near the ground, consequently he stumbles more or less, and the trouble is manifested in turning. When loose he runs and plays as if nothing was wrong.—Subscriber, Palmdale.

The symptoms given are those which accompany the development of coffin-joint disease. The disease has become chronic and is incurable. Moderate work, proper shoeing and the use of some hoof-packing, or frequent soaking in cold water to prevent contraction of the hoofs, are recommended. Lengthen the heels and shorten the toes and apply shoes with lapped heels and rounded toes.—F. G. M.

Anemia.

I have a horse which eats well and his coat is fine, but he remains very thin in spite of the fact that we have tried all kinds of remedies to make him fat. We gave him worm remedies without avail. He is always hungry and, at times, eats manure.—Subscriber, Anaheim.

Take your horse to a qualified veterinarian and have his teeth examined and defects corrected. If the teeth are not considered at fault, have the veterinarian administer a vigorous purgative to be followed by alteratives and tonics.—F. G. M.

EXPORT TRADE IN PERCHERONS.

Importations of Percheron horses have been made for more than sixty years, are still considerable, and are well known. It will, however, be a surprise to many to learn that exports of Percherons have grown to considerable proportions, and are rapidly increasing.

John W. Brant, accountant Canadian National Live Stock Records, advises the Percheron Society of America that Percheron importations to Canada in the past two years are as follows:

In 1909, 283 head, about 65 per cent from the United States; in 1910, 442 head, 45 per cent from the United States; in 1911 from January 1st to July 17th, 264 head, 67 from France and 197 from the United States.

Manitoba, Saskatchewan and Alberta have taken the most, but a good many have gone to Ontario.

An aggressive advertising campaign has been waged by the Percheron breeders in Canada, and their aggressiveness in bringing out good shows at the leading Dominion fairs has brought the breed into general notice, so that the Percheron migration to the Canadian provinces promises to be greater than ever this fall.

Mexico has also taken some Percheron shipments, although the political disturbances which have prevailed there for the past year have put a damper on business. The International Land and Live Stock Company, of Jimenez, Chihuahua, has made several purchases, however, and Manuel M. Urquiza, who is located near the city of Mexico, has made some shipments and has also exhibited his Percherons at some of the Mexican live stock shows.—Wayne Dinsmore, secretary.

If your cow has obstructed teats, be very cautious about inserting milk tubes, probes or quills. Nothing of the kind should be inserted in a cow's teat excepting as a last resort, and then only with the most extreme care and cleanliness.

A sunny, clean barn means more contented cows.

GOMBAULT'S

CAUSTIC BALSAM

A safe, speedy and positive cure for

Curb, Splint, Sweeny, Capped Hock, Strained Tendons, Founder, Wind Puffs, and all lameness from Spavin, Ringbone and other bony tumors. Cures all skin diseases or Parasites, Thrush, Diphtheria. Removes all Bunches from Horse or Cattle.

As a **HUMAN REMEDY** for **Rheumatism, Sprains, Sore Throat,** etc., it is invaluable.

Every bottle of **Caustic Balsam** sold is Warranted to give satisfaction. Price **$1.50** per bottle. Sold by druggists, or sent by express, charges paid, with full directions for its use. Send for descriptive circulars, testimonials, etc. Address

Queries

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Covering Irrigation Furrows.

After irrigation I notice suggestion for filling in furrows immediately after water is turned off. It is not clear to me whether this is done by crossing or by driving parallel with the furrows. Is there any danger of horses miring in some soils?—Subscriber, Greenfield.

Each irrigator must use his own judgment and consider the conditions of his own soils. Ordinarily the furrows are laid so as to leave a dry place down the center and on this the horse is driven, though if the furrows are far enough apart it is probable the horses could be driven on the top with safety. At the lower ends where the water has stood, as the subscriber suggests, there is danger of miring. In this case the horses can be kept off until the ground is settled. Crossing the furrows, with trees of any size, would leave spaces opposite each tree which would not be covered, so we would prefer very much to cover by driving the same way.

Drying Prunes.

Please give full directions for dipping and drying prunes and all care of them on the ranch.—Subscriber, Kingriver.

If you desire to secure the rich black prune soft to the touch be sure the fruit is perfectly ripe. Vigorous shaking of the tree will bring down fruit that is altogether too green. Dip immediately after they are gathered, as if allowed to remain in deep boxes over night they sweat and make a lower grade product. Be sure your lye is boiling, as heat is a material factor in successful dipping. The usual proportion is one pound of lye to each ten gallons of water. Some do not rinse after the lye dip, but we believe a better product is secured by the rinsing. Spread the same as any other fruit on trays for drying only one layer deep and be sure to collect and protect from rains. This can be done with the ordinary tray and still allow access of air so there is no danger of molding. When cured, and this does not mean they are to be dry, they may be covered in the boxes to sweat and equalize the moisture. Unless the fruit is sized before drying the smaller ones will be overdried, and here comes in the value of experience of the one in charge. After the sweat they are sometimes given a salt dip, five pounds of salt to 100 gallons of water. Besides this, some prefer a syrup dip, which gives a glossy appearance to the fruit. This syrup is usually made by mashing and boiling small and cull prunes. Then they are packed in the usual size 25 or 50-pound boxes and are ready for market.

Cost of Line Fence.

How is the cost of line fence between two and a half acre ranches divided between owners?—Reader, Alameda.

The cost of the fence should be divided equally between adjoining property owners, regardless of the number of acres in each place, that is, where the properties adjoin one ranch may be of 100 acres and the other of ten, yet if there is 1000 feet of fence between them the cost should be equally divided. Of course this depends upon the willingness of both parties; neither party can be compelled to join in the fence construction. In such a case one man may build the entire fence and then later, if conditions change so that the other takes advantage of the fence, he may be compelled to pay his half.

Lady Birds.

Can you tell us a good way of taking care of lady birds? They have done us lots of good this year by destroying aphis. It seems much more effective than by spraying. How can they be raised and housed or protected or carried through?—Subscriber, Greenfield.

(Continued on Page 233.)

Land To Rent

10 in. Well Sec 33. Artesian flow. Exact reproduction of photo.

in artesian belt of Kern County, N. W. of Wasco, either for cash or share of crop with option to purchase if desired at $100.00 per acre. The land is good for alfalfa, cotton, grain, etc. 204 sacks of onions weighing 100 to 105 lbs. to the sack raised on ½ acre.

All conditions favorable for making money.

Preference of employment given to renters on Company's Improvement Work. Wanted men to rent at once who have stock and tools for road and ditch work.

This week we begin operations upon the ground by opening a ranch headquarters on Sec. 17. Stock, implements and grading tools have been provided to operate the company's experimental farm and to give immediate employment to renters on ditch work. Some of the best paying crops should be planted in October. Write us and make arrangements to visit the land at once.

Barber, Publisher, R. 430, 28 W. Jackson Boulevard, Chicago, Ill.

FARM LANDS FOR SALE.

For Sale—

OWENS RIVER VALLEY

RED APPLE LAND.

Los Angeles' new water supply from the Owens River Valley opens up the most fertile land in all of Southern California. This land is wonderful in its productiveness, beyond belief. Potatoes that run as high as 500 bushels to the acre, with an average of 330; alfalfa, 3 tons to the cutting; timothy, with 10-inch heads; corn, 70 bushels to the acre, and famous for hogs; the world's prize at the Portland Exposition for honey; the finest apples grown on the Pacific Coast, Spitzenbergs and Winesaps, the famous varieties; no better poultry country in California.

No other land in California can compare with it; foothill land with gentle slope, giving perfect drainage; one of the most complete gravity concrete water systems in the State now being installed by men whose irrigating systems in the orange belt of Southern California stand as models for model orchard irrigating. Water from the hundreds of lakes and the high Sierras, giving an inexhaustible and assured supply. The Southern Pacific's new main line to the East now runs through the valley. The choicest apple land will be subdivided into ten, twenty and forty-acre tracts.

The elevation is 4000 feet. Typical California summers, with no intense heat, and with the thermometer at 10 deg. above at the coldest. Practically no rain—about four to five inches during the entire year; 300 days of sunshine, absolutely no fog; has the finest scenery in America; the high Sierras at your very door; trout streams within walking distance. You can leave the valley in the morning, go to the summit of the Sierras, 14,000 feet elevation, camp at one of the beautiful mountain lakes and return to your home the same evening.

This land is not for speculators, but for real serious farmers, who know the value of good land and water when they see them. Will send pamphlet and pictures upon application.

The JAMES R. H. WAGNER CO.,
Room 10,
329 So. Hill St.,
Los Angeles, Cal.

Please mail, without expense to me, your printed matter on Owens River Valley lands.

About the only way of giving na-
ural protection to the lady birds is
he planting of corn or some other
eavy growing plant in which they
ay hide during the hotter weather.
Vhen gathered in the Sierra Nevada
n the springtime they are placed in
old storage to keep as nearly dor-
ant as possible and later liberated
n the fields. We have asked the
tate commissioner as to best methods
or affording protection for these val-
able little assistants.

he Dasheen.

The Cultivator has had inquiry re-
arding a tuber called the dasheen,
ut we are unable to get any very
efinite information regarding this and
s commercial value. The Depart-
ent of Agriculture is testing it out
nd no doubt within a year or two will
e able to distribute sufficient for ex-
erimental plantings over the country.
Ve have from Mr. R. A. Young,
cientific Assistant of the Bureau of
lant Industry, the following:

"We do not know at present of any
ersons who are in position to supply
e most desirable variety of dasheen,
e one that has been referred to par-
cularly in the various accounts that
ave appeared in the magazines and
ewspapers. The department is grow-
g this variety, but as a sufficient
ock for distribution has not yet been
ccumulated, we shall use all of this
ear's crop for further propagation
xt season. Applications from exper-
enters who desire to grow the
sheen will be filed and the material
ll be sent as soon as available."

ertilizing Valencias.

We have a letter signed merely
lendora" in which the writer says
has 700 five-year-old Valencias on
ich he has put seven carloads of
rnyard manure with tankage. He
shes to know if this will cause puf-
g if put on in August, also what is
e percentage of nitrogen, phosphates
d potash in one ton of fertilizer,
od cow and sheep manure, alfalfa
d tankage which comes from a
ughter house.

We do not think there is any danger
oranges puffing from such fertiliza-
n, but as to giving any estimate of
ntent of various elements, that is
possible from information given.
d "Glendora" shown us the courtesy
signing his name, we could have
itten him and asked more particu-
s.

alfa on Damp Land.

have a field of alfalfa which sub-
igates for some weeks during the
nmer so that the tap roots become
ten up to a foot or so of the surface
ground, thus weakening the growth
plants, and some die. Would it
atly encourage new roots and re-
e the plant to plow the field under
l leave undisturbed for another
r's growth? New plants do well
about two years. How deep should
e plowed?—M. D. W., Livingston.

Ve do not believe alfalfa can be
cessfully grown under such condi-
ns. Drainage by tiling or open
ches might put it in condition so
t alfalfa would grow excellently.
less this is done, we would choose
er crops which would stand wet
t, as alfalfa never will. Reseeding
l not produce enough of a crop to
.

ails in Spring.

What will destroy water snails
und spring which is kept well
aned and aired?—Subscriber,
aldsburg.

Ve would advise placing a few
ps of quick lime in the water
und the spring. Bluestone put into
water would accomplish the same
pose, but if stock is watered there
might prove injurious. The lime,
however, would only sweeten condi-
tions and probably be beneficial.

Aphis on Apples.

I enclose apple twig infested with small green lice. What are they and what will control them?—Subscriber, San Luis Obispo.

Spraying with tobacco mixture or with kerosene emulsion will destroy these aphids, but as they reproduce with great rapidity another generation will appear in a few days and spraying should be repeated.

WITTE ENGINES

GAS—GASOLINE—DISTILLATE—NAPHTHA

Do the work at average cost of **One Cent** per horse power hour. Immense saving by our method of "pre-heating" the fuel. Built so perfectly that repairs cost less than **$1** per year average. Every valve is **vertical** and will not wear on the stem or slip inside. Freezing cannot injure bed as **cylinder and base** are **separate.** Hammered steel cranks, cut gears, etc.

GUARANTEED FIVE YEARS

We are experts in engine building; have done nothing else for twenty-six years. Our reference is thousands of satisfied customers. Our prices are right. All sizes, 2 to 40 H. P. Special inducements to introduce in new localities.

531 Hunter Bldg., Chicago

MELILOTUS CLOVER

The Favorite Cover Crop

This most wonderful of nitrogen gathering plants possesses also the advantage of a deep root system which brings up the potash and phosphorus in dense soils. As a producer of humus and nitrogen for orchards it has no superior. Alkali land is made rich and productive with a few crops of Melilotus clover.

Planting season is near and the prices on our splendid, fresh, recleaned seed will be attractive to you.

We carry full stocks of all other cover crop seed—Vetch, Burr Clover, Fenugreek, Peas, Beans, etc. Write for prices and further information.

Farmogerm is a practical culture of nitrogen gathering bacteria which is easily applied and will increase a cover crop fifty to two hundred per cent. Our booklet on this subject is intensely interesting—write Dept. C for a free copy.

How Much

are Your Buildings and Contents Worth?

Are They Worth 35 Cents?

Yes, this is said seriously. Don't you know that the average farm fire is a total loss? Yet ninety-nine fires out of every hundred could be extinguished if proper equipment were at hand. What would you do if fire were to break out in your farm buildings tonight?

THE MAGIC EXTINGUISHER

will put out ninety-nine out of every hundred of these fires.

To operate it, turn it upside down.

It throws a chemically charged stream forty times more effective than water to a distance of 50 ft.

It costs $12.00 delivered at your nearest railroad station.

It can be used any number of times and when emptied can be re-charged at a cost of 35 cents.

Think of the additional security if you had one of these on each floor of your dwelling and in each building on your ranch. Can you afford to take the risk of losing any of your buildings that an expenditure of 35 cents might save?

Order extinguishers today for each building on your ranch.

"Fire Fighting on the Farm," an instructive booklet free for the asking.

Household Department

THE HORSE AND THE DOG AND THE MAN.

The horse and the dog had tamed a man and fastened him to a fence.
Said the horse to the dog, "For the life of me, I don't see a bit of sense
In letting him have the thumbs that grow at the sides of his hands, do you?"
And the dog looked solemn and shook his head and said, "I'm a goat if I do."

The poor man groaned and tried to get loose and sadly he begged them, "Stay!"
You will rob me of things for which I have use by cutting my thumbs away!
You will spoil my looks, you will cause me pain! Ah, why would you treat me so?
As I am, God made me, and he knows best! Oh, masters pray let me go!"

The dog laughed out and the horse replied, "Oh, the cutting won't hurt! You see
We'll have a hot iron to clap right on, as you did in your decking of me!
God gave you your thumbs and all, but still the Creator, you know, may fail
To do the artistic thing, as he did in furnishing me with a tail!"

So they bound the man and cut off his thumbs, and were deaf to his pitiful cries,
And they seared the stumps and they viewed their work through happy and dazzled eyes.
"How trim he appears," the horse exclaimed, "since his awkward thumbs are gone!
For the life of me I cannot see why the Lord ever put them on!"

"Still it seems to me," the dog replied, "that there's something else to do;
His ears look rather long to me, and how do they look to you?"
The man cried out, "Oh, spare my ears! God fashioned them, as you see,
And if you apply your knife to them you'll surely disfigure me!"

"But you didn't disfigure me, you know," the dog decisively said,
"When you bound me fast and trimmed my ears down close to the top of my head!"
So they let him moan and they let him groan while they cropped his ears away,
And they praised his looks when they let him up, and proud indeed were they!

But that was years and years ago, in an unenlightened age!
Such things are ended now, you know; we've reached a higher stage!
The ears and thumbs God gave to man are his to keep and wear,
And the cruel horse and dog look on and never appear to care!
S. E. Kiser, in Chicago Record-Herald.

THE UNEXPECTED CHALLENGE.

It all happened so long ago that I can set down, without fear of raking up old scores, a certain adventure which befell me when I was a student at Leipzig.

Max von Bestoff was an officer in the German army and, it was said, had risen from the ranks to his present position through sheer force of push and persistence. He was tall, good looking, with a voice of one accustomed to command (which awed the unwary not a little) and was, by reputation, amazingly arrogant and insolent. He could convey various impressions without spoken word by a look or gesture, and, dressed in his fetching soldier's uniform, with an air of complete self-posession and assurance, it was, perhaps, not strange that he was a conspicuous figure in Leipzig, as he walked firmly and swiftly through the street, his sword swinging jauntily at his side and his gold spurs clicking.

I remember him well, one glorious winter's day, when Bertha Wallace and I were skating in the great park in Leipzig. The band was playing gay melodies, and the wind blowing keen on my face aroused in me a hundred boyish dreams and sent the blood coursing through my veins. Bertha was the daughter of the American consul, but just at that particular period in my career she seemed to my luxuriant fancy more a goddess than an agreeable young woman with china-blue eyes, a babyish mouth and a tiny nose; though a photograph of her (which my wife unearthed from a trunk in the garret the other day) shows her face to have been not without character. We had paused a moment in our sport to buy and eat a pretzel, and happened to stop near a young German in soldier's uniform who was helping a pretty girl put on her skates. He had just fastened one skate when he turned to find Max von Bestoff beckoning to him. It is well known, of course, the world over, how strict are the rules of the German army, and the young soldier, humiliating as it was, found himself obliged to leave his pretty Fraeulein with one skate on and one off, while he went meekly to fasten on the skates of his superior officer, von Bestoff, who deigned not so much as a "thank you," but glided off, to the admiration of the crowd, as though life held no problems and presented no difficulties for him. The poor soldier had turned scarlet, but came back, and with perfect quiet and restraint finished fastening on the young girl's skates.

"That's von Bestoff all over," remarked Bertha.

"An infernally insolent and ill-bred thing to do, and no civilized man with a spark of decency in him would play such a trick," I answered, for I found myself unable, in this noble land, to shed the American man's sense of what was due a woman, and the absurd arrogance of some of these German officers stirred an inward fire that I felt might burst forth some day, when I would fling my devil's measure at them with a will.

"Oh," replied Bertha, "but he's so good looking!"

"He's a conceited cur and needs a sound thrashing," I retorted, feeling angrier than the occasion demanded. Bertha looked up at me with mischief in her blue eyes.

"I would like to see you try it—are you proposing to spread the American eagle for his benefit?"

"We shall see," I said, grimly, nettled at her tone, "I've tackled worse problems."

"Oh, I suppose you wouldn't falter before any problem under the sun would you?" she went on, teasingly but just here von Bestoff came toward us, with his arrogant air of importance, and, acknowledging my presence with the slightest possible nod asked Bertha to skate, which stirred my youthful spleen, and I looked after them half in rage, half in despair and longed with every muscle in my body to teach him a lesson then and there. I was very young in those days!

As time went on, von Bestoff seemed more and more to find the Wallace house as agreeable as I found it, and

to my simple-minded chagrin Bertha one day informed me that she was beginning to see the German in a totally different light, and with a new, keen appreciation. I, on the contrary, didn't find his presence any the more soothing, and when he was about Bertha charged me with looking glum and disapproving; perhaps I did, for I did not care to know any more of von Bestoff than I knew already.

One of his most objectionable tricks was a little habit he had of walking down the street, straight as an arrow, with his head in the air, pretending not to notice who or what was in front of him, seemingly taking it for granted that the crowd would step meekly to one side that he might go on his easy way without let or hindrance. I had taken particular note of this little idiosyncrasy, and made a vow, when the chance offered, to punctuate his stroll by a certain football trick I had learned with profit when left tackle at Harvard not so many years before, and I fancy I was not the only man in Leipzig in those days who had an unholy desire to hack von Bestoff into a shapeless chunk—if the occasion arose.

"Sauerkraut-sausage-eating dog of a German," I would mutter to myself, "swashbuckling about like a peacock in his opera-bouffe uniform, does he suppose for a moment he can awe me with his devil's air of superiority?" For although I had said nothing to Bertha of what was uppermost in my thoughts, von Bestoff's air of budding ownership in regard to her whenever I was present—inspiring at first only flippant jests and laughter—had begun to make me ponder my chances somewhat. Affairs seemed to be taking a very serious turn with surprising suddenness.

Thus, late one Sunday afternoon, I had just left the Wallace house, when, coming directly toward me and heading toward the same house, I saw von Bestoff, with his usual swing and stride, his head in the air, his spurs clicking, and apparently under his customary illusion that I and every one else would gracefully make way for him. I, however, squared my shoulders and walked straight on, and as he swerved not one inch to the left or to the right, neither did I; but, turning suddenly, my burly football shoulder struck him square on the chest, and he staggered back furious and breathless, the unexpected shock of the blow causing him almost to lose his footing. Blind with rage, and savagely accosting me with a string of German oaths, his hand went by instinct and quick as lightning to his gleaming sword-hilt. He hissed something in German to the effect that "Arms don't grow soft at the anvil," and drew his sword half way out of the scabbard. At this, my American blood was up in an instant, and, retorting "Nor do American hearts falter at the sword's point," I struck out with my good right arm straight from the shoulder, and, catching him squarely under the chin, he fell heavily, sprawling his length on the sidewalk. There he lay stunned for a moment, in his fine blue uniform, all faced and slashed with gold, the blood streaming from his face. The sword still hung half way out of its scabbard, and I, leaning forward, quickly drew it out full-length and, taking it in both hands, broke it across my knee; then placing the pieces crosswise on his body, I put my visiting card underneath them and strode off, happy in the thought of assuring Bertha that for once the American eagle had been spread to good purpose.—Country Gentleman.

REMEDIES FOR SKIN TROUBLES.

Some of the best remedies we have for skin troubles are just simple things that can easily be prepared at home. Sulphur is almost a specific for pimples and blackheads and sulphur soap is a great help for this trouble. An excellent salve to use is made by mixing well together one teaspoonful each of lard and flowers of sulphur, but one must be very careful not to get it in the eyes. A good remedy for dandruff is made by beating the white of an egg with three tablespoons of fresh lard and then adding a little bergamot and putting in a small jar for use. A good remedy for tetter is made by mixing well together one teaspoonful of good vaseline with one drop of carbolic acid, and this is also fine for fever blisters. To prevent bed sores rub with alcohol several times a day, and if the sores have already appeared, place a clean sheep skin with the wool side up under the sheet under the patient, as the wool admits the air and ventilates the sores. For salt rheum, slice pokeberry root and fry it in lard, then rub this salve on the hands three or four times a day until relieved. Another good remedy for tetter, eczema and ringworm is made by soaking tobacco in warm water to make a strong tea.

A good remedy for ivy poisoning and other poisonous vines and plants is made by beating green tansy leaves in rich buttermilk until the milk is thoroughly tinctured and bathe the parts often with this mixture until relieved. This same mixture is said to be good to remove freckles, but one of the best remedies for freckles is made with four parts of lemon juice, two parts of sugar and one part boric acid powder.

Feet that perspire freely should be bathed every day in water in which a little alum is dissolved, and then dust a little dry boric powder into the sole of each shoe every morning. There is nothing better to check perspiration on other parts of the body and to destroy the odor than the dry boric powder used freely and there is no better powder to prevent chafing on young children than equal parts of boric powder and pulverized starch, well mixed.

For pimples on the face dissolve a little of this powder in hot water and use it warm night and morning for bathing the pimples. This boric solution is excellent for any irritation of the skin, and especially good for an irritated, itching scalp, when applied every night.—A. M. H.

TO REMOVE IRON RUST.

Make a solution of tartaric acid by dissolving one teaspoonful of the powder in one-half a cupful of water. Dip the spots of rust in this and hang in the sun a few minutes. It will disappear as if by magic. If the rust is of long standing a second application of the solution may be necessary or even a third. This will remove all the color, so it can only be used on white goods. It is harmless to the fabric, is a vegetable acid and acts like lemon, only it is much more powerful.

PROLONG THE LIFE OF A BROOM.

When seventy-five cents has to be paid for a broom that formerly cost fifty cents, and fifty cents for a thirty-cent broom, it behooves one to make them last as long as possible.

Always hang a broom up, or at least stand it on its head. This makes the broom-splints very tough, yet they will not cut the carpet; it also makes the broom last longer, besides always sweeping like a new broom.

Digging asphalt from Trinidad Lake

A roof is only as good as its waterproofing.
Knowing this, will you buy the covering for *your* roof on its "looks" alone, and not know what it is made of?

Genasco
the Trinidad-Lake-Asphalt Roofing

is waterproofed entirely with *natural* asphalt. In Trinidad Lake this asphalt has resisted blazing sun and terrific storms for hundreds of years. It has natural oils that give it lasting life in a roof despite the buffeting of rain, snow, sun, wind, heat, cold, and fire.

Man has tried to *make* lasting waterproofers—and always failed. Ordinary ready roofings show you what happens. They are made of mysterious "compositions" or coal tar; and they soon crack, break, leak, and go to pieces. Yet as for looks, they are mighty good imitations.

The life and backbone of Genasco is Trinidad Lake Asphalt—the *natural* everlasting waterproofer—and that makes Genasco last.

Genasco is made with mineral and smooth surfaces. Guaranteed, of course.

The Kant-leak Kleet waterproofs the seams of roofing thoroughly without the use of smeary unsightly cement, avoids nail-leaks, and gives the roof an attractive appearance.

Ask your dealer for Genasco Roofing, with Kant-leak Kleets packed in the roll. Write us for the Good Roof Guide Book and samples.

COOL WATER IN THE HOT SUN
"NO MR SUN! YOU CAN'T WARM THE WATER IN THE APPELL WATER BAG"

APPELL'S South African WATER BAG

Keeps water cool 48 hours or longer, in sun or shade: great boon to prospectors, surveyors, sportsmen, stockmen, farmers, teamsters, anyone exposed to dry or warm weather. Used by U. S. Gov't. Strong, light, easy to carry. Guaranteed

Take no Substitute

This Letter Typifies the Attitude of All Users

Gentlemen: Elkhart, Indiana.

While in Nevada recently I had occasion to drink out of one of your South African Water Bags. Water from the bag certainly tastes good on the desert. We used one of your 2½ gallon bags and *the water remained cool all day, even though the temperature was over 100 in the shade*, and in the morning I found the water sparkling and as cold as ice water. It certainly is a boon to those living in the arid regions.

Yours Sincerely, W. E. WIDER

Hay.

Scott, Magner & Miller say:

Arrivals of hay for the week have been 5,300 tons. On Monday morning the market received over 1,500 tons, and it was thought that perhaps this large amount for the opening of the week would tend to weaken the market considerably, but this did not occur, for the reason that the hay was all in strong hands, and was taken care of at full figures, and no weakness developed in any portion of the market. The following few days arrivals were moderate, and the railroad trucks were cleared of all accumulations.

The market on alfalfa continues fairly steady under the prevailing conditions for this type. There are large lots being offered freely and on a little lower basis than heretofore, as many holders who have not sold their hay appear to be anxious to make a deal for the movement of their hay to market.

We quote the wholesale prices in round lots on today's market as follows, viz:

Fancy wheat hay	17.00@18.00
No. 1 wheat or wheat & oats	15.50@16.60
No. 2 wheat or wheat & oat	12.00@13.00
Choice tame	14.50@15.00
Other tame oat	10.00@13.00
Wild oats	10.00@12.50
Stock hay	5.50@6.00
Alfalfa	9.00@11.00
Straw, bale	55@60

Deciduous Fruit Market

Manager F. B. McKevitt of the California Fruit Distributors reports:

Sacramento, Sept. 2, 1911.

The following gives the number of cars of deciduous fruit shipped from all points in California for the week (seven days) ending Friday morning, September 1, 1911:

Peaches—85¼ cars. As indicated last week, there has been a heavy decline in shipments of this variety, amounting to nearly 150 cars. Salways are going forward in a small way and will be in larger volume next week. There are also a few Clings available. Owing to large sales of all varieties of peaches to canners and the low prices prevailing for this fruit in Eastern markets, it is not likely that more than two, or at the outside, three hundred cars of peaches will be shipped from this state during the remainder of the season. The principal supply of Salways during the next week will come from Placer County.

Plums—63¼ cars. This variety shows a falling off of more than 50 per cent from last week. It is not likely there will be more than forty cars shipped out during the next seven days. Most sections have completed the shipment of this variety.

Pears—159 cars. A decline of over 100 cars from last week is noted here. Bartletts are coming almost entirely from the mountain sections. A few fall pears are going forward from the Santa Clara and San Lorenzo districts. Winter Nelis are reported to be of fine quality and a fairly good crop. Comice are generally reported a short crop.

Grapes—343½ cars. Malagas still continue offering from the San Joaquin Valley. Principal movement, however, is in Tokays. Florin and Lodi are now shipping the latter in considerable quantity. Movement will undoubtedly be heavy next week and during the remainder of the season. We have the best crop of grapes ever raised in the state and of the finest quality. Prices will be exceedingly reasonable.

Weather conditions continue fine.

Comparative statement of shipments up to August 26, 1911:

	1910	1911
Cherries	250½	216¼
Apricots	289¾	214½
Peaches	1981¼	1740
Plums	1562	1270
Pears	2083¼	1747¼
Grapes	1098	791¾
Apples	228¼	10
	7484	5990

Citrus Fruit Market

Los Angeles, Sept. 6, 1911.

The large number of small sizes of Valencias is causing a weak condition, excepting on regular size and good fruit. But little "greening" has been noticed, and the general quality of the fruit is of the very best. The general tone of the market is good, and without question the first of November will see everything cleaned up and at fair prices.

The foreigns are in very light receipt and California lemons are going out in finest quality. The result is that for the season of the year fair prices are being obtained. The promise for the next few months is that satisfactory prices will prevail.

Shipments.

Shipments of oranges to date since November 1, 1910: 35,620 cars, lemons 6,212, total 41,832. To same date last season: oranges, 24,472 cars; lemons, 4,413; total, 28,885.

NEW YORK, Sept. 5.—Twelve cars Valencias, one lemon sold. Market doing better on Valencias; strong on lemons. Fair.

RIFE ENGINE CO., 2491 Trinity Bldg. N.Y.

Wagon Hubs

Why do all manufacturers of the leading farm and freight wagons sold in California—WITH ONE EXCEPTION—use white oak hubs, when it is the most expensive timber used for the purpose?

BECAUSE WHITE OAK is the only hub timber that will stand the peculiar climatic conditions existing in California and the heavy work required of mountain and farm wagons.

BIRCH HUBS have been tried, probably by all manufacturers, and discarded WITH THE ONE EXCEPTION above referred to on account of its softness and liability to "dry rot" when exposed to the weather.

THE WEBER AND COLUMBUS WAGONS manufactured by The International Harvester Company, of America, use White Oak Hubs exclusively.

Genius is common sense intensified. It is the power of making efforts. It is patience. It is the talent for hard work. There is no genius like the genius of energy.

Good manners is the art of making those people with whom we converse feel easy. Whoever makes the fewest people uneasy is the best bred in the country.—Swift.

SAVE MONEY
ON YOUR POULTRY SUPPLIES

Every price quotation here given is positively the lowest for which dependable qualities can possibly be sold.

Thousands of ranchers and poultry raisers concentrate every purchase here because of the great saving in the cost of everything they need.

WE ALSO FEATURE OTHER FAMOUS STAYCO PREPARATIONS FOR VARIOUS USES.

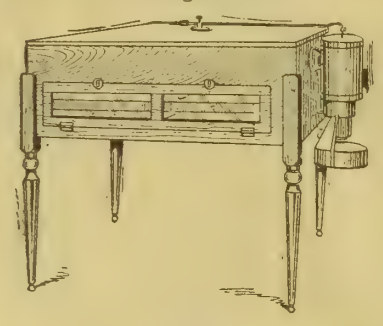
INCUBATORS.

Made in Our Factory—No Middleman's Profits.

This is a line of Incubators for those earnest poultry keepers who want nothing but a reliable Hatcher.

These Incubators are made of wood, covered with heavy galvanized iron, well finished. They are double walled; the space between being packed with cotton batting. The tops are also packed with several thicknesses of the same material to protect them from the changes of outside temperature. The windows are of double glass with air space.

The heater, the Thermostat, the lamp rest, the shield and deflector are of the best throughout.



1911 Model.

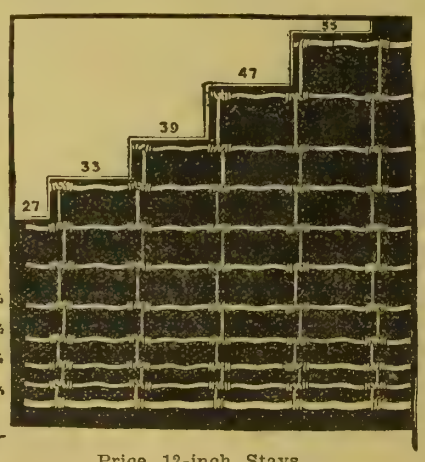
SQUARE MESH FARM FENCE.

Style No. 12.

Prices f. o. b. factory, Stockton, Cal. Height 27 to 55 inches. Rolls 20, 30 or 40 rods each. Stays 6 inches or 12 inches apart. Top and bottom wires No. 9, intermediate line wires No. 11, stay wires No. 12. All wires of high carbon self-regulating coiled spring.

. The Tie in this fence is so constructed that it pulls tighter under strain instead of loosening, as is the case with ordinary fence ties. The greater the strain the tighter the wires lock together. The tie also aids in giving the fence rigidity, and reduces to the minimum the liability of the fence crushing down. Stay wires will not slip.



Price 12-inch Stays.

Vol. XXXVII. No. II. LOS ANGELES: THURSDAY, SEPTEMBER 14, 1911 One Dollar the Year

California's Wild Flowers Worth Wide Planting

Address by Theodore Payne of Los Angeles Before Pacific Coast Nurserymen's Convention at San Jose

California has furnished some of the most valuable plants known to the horticultural world; many flowers and shrubs which we here pass by because they are wild are cultivated and greatly prized in Europe, and we, on the

ORTHOCARPUS PURPURASCENS

other hand, prize anything imported from foreign countries. Many of these imported plants are not adapted to our climate and conditions, and at best they need care and irrigation.

It seems a pity that we should nelgect to cultivate more of our native shrubs and flowers. For those who have large grounds and a small water supply, many native shrubs can be grown to advantage. It is not the object of this paper to attempt to enumerate all the species that should be grown, but simply to give a few of the most desirable.

Annuals.

First I will mention the annuals, as they are the ones which give the quickest results, with the least possible labor and expense; later on, I will take up the perennials, shrubs and trees. For large places, where there are trees, banks and slopes, hollows or open stretches of ground, the most marvelous effects can be produced in a few months by sowing the seed broadcast in these spots; while for small gardens a patch of native annuals would always be a source of great interest and beauty.

In sowing California wild flower seeds, follow nature as much as possible. Scatter the seeds broadcast over the ground, and let them come up after the rains commence. Many of our vacant town lots could be sown broadcast with wild flowers, producing little beauty spots for several months of the year.

Of the several species mentioned here, the California Poppy (Eschscholtzia Californica) is of course well known and generally cultivated. Though truly a perennial, it may be included here among the annuals, as it blooms in such a remarkably short time from seed.

The Nemophila insignis (Baby Blue Eyes) is well known and cultivated in Europe and the Eastern States, but is not often seen in our gardens; it is a most charming little plant of spreading habit, and in a few months from the time of sowing will cover the ground with a perfect mass of sky blue flowers. Nemophila maculata is of similar habit, but with white flowers with a deep purple blotch in each petal.

Mimulus brevipes (Yellow Monkey Flower) is perhaps one of the most showy annuals; many hillsides are yellow with this flower early in May. The flowers are large, rich canary color, and contrast well with the bright green foliage.

Clarkia elegans is a slender-branching plant with attractive flowers, pur-

MIMULUS BREVIPES

ple with white and crimson stamens.

There are three very handsome daisy-like flowers which are common on sandy soil; Layia glandulosa (White Daisy), which has large, pure white flowers with yellow centers; L. elegans (Tidy Tips), in which the petals are yellow tipped with white or cream; Coreopsis Douglasii (Yellow Daisy), a tender looking, graceful plant with finely cut thread-like leaves and yellow flowers of a peculiar brightness, more sunshiny than buttercups.

Of the lupins there are a great many species worthy of cultivation, but of the annuals, Lupinus affinis (Dwarf Blue Lupin) is perhaps the most desirable. It has very showy spikes of rich purple and blue flowers.

Three species of the Gilia which are particularly easy to grow are Gilia Achillaefolia, a slender growing plant with finely cut foliage and heads of rich blue flowers; Gilia abrotanifolia, a taller growing species, with large heads of very pale blue, almost white, flowers; Gilia tricolor, with pale lilac flowers with yellow and purple in the center. Another beautiful flower, closely allied to the Gilias, is Linanthus densiflorus or California Phlox. This also is extremely easy to grow. The plants attain a height of about one and a half to two feet, and bear large clusters of pale pink, phlox-like blossoms.

One of the most showy of our native annuals is the Blazing Star (Mentzelia Lindleyi). It has strikingly beautiful flowers of a rich golden yellow, almost as large as a poppy; this would be very effective for massing in beds.

Orthocarpus purpurascens (Owl's Clover or Pink Paint Brush) is a much branched little plant, bearing large heads of small flowers, color cream shading to rose, pink or purplish lavender. A white form is also found, though not very common.

The Phacelias are very showy flowers. P. Whitlavia (Wild Canterbury Bell) has large bell-shaped flowers, of a rich violet purple. P. Parryi has saucer-shaped flowers, deep violet, generally with five yellow spots; P. grandiflora is a taller growing species, the flowers varying in color from lavender to white, beautifully streaked and veined with violet purple.

In a shady situation Collinsia bicolor (Innocence) will do well. It is of graceful habit, with bright green foliage, flowers in clusters regularly disposed, suggesting rows; upper tips white or lilac, lower violet or rose colored.

Godetia Bottae (Farewell to Spring)

LAYIA ELEGANS

also likes the shade. The plant is of rather slender growth, with pale rose or lilac colored flowers.

Godetia grandiflora is a magnificent species, and will grow either in the shade or open sunlight. The flowers are often three inches across, of a delicate pink, blotched with rich crimson. One plant which must not be omitted here, and one of the most handsome, is the Thistle Sage (Salvia carduacea). It has thistle-like wooly foliage, and large, airy, fantastic heads of blossoms of a pale lavender shade.

Perennials.

In perennials I will first mention the Pentstemons. Of these we have several species. P. spectabilis is perhaps the most showy of all. The plants grow from four to seven feet high. The flowers are large and in great spikes, often three feet long, color is the richest combination of blue and royal purple. P. centranthifolius (Scarlet Bugler) has long spikes of rich vermilion flowers which contrast well with the handsome glaucous foliage. P. cordifolius or Scarlet Honeysuckle, as it is often called, is a tall, woody plant, usually growing among shrubs, which it uses for support, the flowers are bright orange scarlet. P. heterophyllus (Violet Beard's Tongue) is a low, bushy plant, with narrow, pale green leaves and spikes of trumpet-shaped flowers, royal purple marked with pink. These four species are all valuable for planting in dry places.

Of the native larkspurs there are two species quite worth cultivating. Delphinium cardinale (Scarlet Larkspur) a tall, branching plant with long spikes of vivid scarlet flowers, and D. Parryii (Blue Larkspur) which grows from two to three feet high and has bright blue flowers.

Mimulus cardinalis (Scarlet Monkey Flower) has pale green leaves and bright scarlet flowers with yellow throat; this grows along streams and so would require a moist place.

The Castillejas or paint brushes are exceedingly showy flowers. C. Martini grows generally on dry hillsides and has bright scarlet flower bracts. C. foliolosa is a little more inclined to pink, but contrasts well with the white wooly stems and leaves. C. Californica usually grows a little taller than either of the preceding, and is perhaps the most showy of all; has dark colored stems and rich scarlet flower bracts.

A flower which should be invaluable for cutting purposes is the Sea Dahlia (Coreopsis maritima) which produces large blossoms on long stems, of a rich lemon-yellow color.

PROCESSING CITRON.

By Special Contributor.

Referring to answer to query in which we gave method of processing citron, a subscriber who has had experience and knows has sent us the following more explicit instructions regarding the handling of this product. The statement is made in the article that the only orchard of any account is at Pedley near Riverside. We believe there is also an orchard or at least several trees near Monrovia in Los Angeles County. The writer says:

Citron grows upon trees; when ripe looking like huge overgrown lemons, many weighing over three pounds apiece when full grown. There is only one orchard of any account in California which is at Pedley Station near Riverside and is owned by the San Jacinto Land Company. This orchard is the only one from which citron is gathered for commerce in the United States.

In preparing citron for preserving it is halved, put in brine for three weeks, and said brine must be strong enough to bear the weight of an egg the entire time the citron is in it. By keeping up the proper strength of the brine, the citron can be kept in storage until necessary to use it, being kept this way many months.

You can not depulp the citron raw, as the fiber between pulp and rind is too strong. The citron is boiled in water from 45 minutes to an hour, which boiling loosens up the pulp so it can be easily removed with a spoon. The boiling also brings out the salt in the fruit and after it is dipped in two washings of cold water, all salt should have been removed.

Now the citron is ready for taking up the syrups. Since the citron has already been boiled in only water for about one hour, its texture is softened up so that syrups can soak through it evenly. A syrup can be prepared thick as honey and the citron boiled in it (do not put into the syrup more than one-half its weight of citron—into 100 pounds of syrup put only 50 pounds of citron), the water in the citron will dilute the strength of the syrup. Hence the water of the citron must pass off as steam during the cooking and at the end of one hour the syrup should be just as dense as at the start. Now the citron can be removed with its syrup and both allowed to stand for nearly a week in some vessel.

At the end of the first week the cook will find that the strength of the syrup has greatly decreased. Now the syrup should be brought to its proper strength and the citron cooked in it a second time.

Each time the citron is removed from the vessel in which it is cooked to the vessel it is to stand in, the syrup should be of proper strength. This recooking should take place as often as the syrup is found below the standard in strength. When the syrup has become constant in density, the citron can be kept stored this way at the desire of the cook as long as the syrup covers the fruit, though it is exposed to the air. Dense syrups are preservatives, but weak ones invite fermentation.

Citron should cure up in the syrup for at least four weeks. After this time the syrup should be drained from it and the fruit allowed to dry upon trays in a dry place away from the sun and the bees. It will take from five to seven days for the fruit to dry.

When it is dried, it is dipped into a crystallizing syrup made from pure cane sugar. This syrup is prepared by dissolving sugar in boiling water until you get a super saturated solution—allow the syrup to stand for five hours when a crust of sugar will be formed upon the top—remove the crust and dip the fruit well. Next lay the fruit upon clean trays and after twenty-four hours standing, a nice crystallization of sugar will cover the fruit. At last the fruit is ready for boxing for shipment.

Note: Prepare your syrups used for cooking three-fifths glucose and two-fifths cane sugar. Cooked in clear glucose the flavor is lost and fruit is too tough. Cooked in straight sugar syrup after standing awhile the sugar crystallizes in it, and transparent condition is lost and fruit becomes brittle.

Orange and lemon peel can be candied according to the same process. There is a market open for more than a million pounds of these peels.

BUDDING CITRUS TREES.

A subscriber at Pasadena has written us expressing appreciation of Mr. G. Ross Robertson's recent comments on budding and pruning citrus trees and asking for further information, especially as to whether to cover the whole "scene of operations," and how long before "uncovering," by which we presume is meant unwrapping or cutting the waxed cloth or string. Also regarding irrigation he wished to know if budding may follow immediately after, or, if not, how long an interval should elapse; further, as to budding guavas. The questions were referred to Mr. Robertson, who is at present at Berkeley, and he writes:

"I take it for granted that the question refers to citrus propagation, although its answer might apply to many other plants with which I have had no experience. Since the use of well waxed tape has a tendency to hermetically seal the buds in, it is advisable to take the wraps off as early as fifteen days. If the tape is left on too long, the bud may be drowned out, so to speak, and become the prey of saprophytic fungi similar to bread moulds. I have removed bandages as early as eight days with no injury to the bud. At the first unwrapping one is enabled to rebud any failures that show up. Care should also be taken to rebind the original buds; but in this operation the bud point or center should be left exposed to the air and light. The bud at the end of fifteen days should really be healed in all around; but on account of the tender condition of the union it needs the support of the rewrapped tape for a week or ten days longer. After the twenty-five days have elapsed the bandages may be removed and the stock be entirely cut back, provided it is spring or early summer. Buds during this and the next month should be left till March or later before cutting back the stocks.

"The only object in delaying budding after irrigation is to avoid flooding the buds with a sudden rise of sap. This is usually a minor trouble, which affects buds that are too small for propagation use. Try cutting buds from large wood; cut them long also. Two inches will not be too long where one is budding fair size stocks. By the use of comparatively large buds one may avoid to a degree the decay caused by sap overflow, simply because there is not enough sap to cover up a large bud. As a practical matter a grower would wait a day or two after irrigation, simply because it is inconvenient to wade and slush around in a freshly wetted clay loam while he carries on the operation. Final results of a large budding job will likely show far more failures from buds drying, rather than from drowning and decaying.

"Inasmuch as I have not had any experience with the guava, I cannot offer anything definite there. The presumption is, of course, that the good old budding rules will work on the guava as with other fruits."

CULTURE OF THE DELICIOUS PAW PAW.

The ripe fruit of this tree eaten for dessert with cream and sugar is not only a delicious dish but takes upon itself the responsibility of the digestion of the preceding meal. It is said that the papaya (paw paw) fruit can be eaten every day for two years without any ill effects. One or two experiments in cooking the ripe or unripe fruit with tough meat will soon convince anyone that with the aid of the paw paw the toughest meat may be made as soft and tender as you please.

The paw paw is really a large herb and hence should be grown from seed the same way as the tomato or melon. Professor P. J. Webster, of the United States Sub-Tropical Laboratory at

Miami, states that less than one per cent of a batch of Florida seedlings bear superior fruit and this accounts for the scarcity of the paw paw on the market. There are great numbers of this fruit growing wild throughout the South Florida jungles and hammocks. They are cross fertilized by numerous insects and moths. Such cross fertilization can be avoided by obtaining good varieties of paw paws from tropical localities where they come true to seed, and pollinating one or two flowers by hand, carefully tying them up in paper bags to keep insects from further pollinating them. By this method there is no doubt but what improved strains can be grown. The paw paw, like the willow and the date palm, has two kinds of trees—the barren, which bears the staminate flowers, and the fruiting tree, which has the pistillate flowers. Rather frequently the former may bear bisexual flowers at the ends of its long flower stalks, which flowers turn into rather small fruits. More rarely the pistillate tree may have some perfect flowers, provided with stamens.

All parts of the paw paw tree, except the perfectly ripe fruits, contain a milk white latex, which exudes from the slightest wound, flowing rapidly at first and then slackening, probably because it coagulates in the latex tubes. The latter soon clots and dries on the plant and so tends to seal up any wound. It has a corrosive action upon the skin, and if the raw latex from green fruits, etc., is swallowed, it may tend to cause intestinal inflammation. The raw latex has an extremely potent digestive action upon proteids. Thus, if a slice of tough meat as beef steak, which in the tropics may be cooked and eaten an hour or two after being killed, is well rubbed with the juice of the paw paw leaves or the green fruits, or even the pulp of the ripe fruit, and cooked, it becomes tender and is readily masticated. The ripe fruit, which does not contain the visible milky latex, acts in the same way on proteids.

When perfectly ripe the fruit of the paw paw is quite soft, but has lost all acridity and the milky juice has disappeared. There is no doubt whatever that this dessert fruit eaten after a good dinner greatly aids the digestive process. It also, like the fig, acts as a gentle laxative.

The paw paw requires a well drained soil and is readily killed by stagnant water about the roots. Thus it grows commonly in South Florida wild, in high hammocks and shell mounds. If grown on rather poor sandy soil, it should be enriched with plenty of humus. If only a few plants are grown, as for home consumption, the following method has been tried in a light volcanic soil in the West Indies, securing excellent results: Dig holes about ten feet apart, in well drained soil, two or three feet deep and three or four feet square, fill them with a compost of soil, farmyard manure, rotting weeds or humus of any kind, adding unleached wood ashes. Plant several paw paws in each of these holes and cover with any good mulch. Of course the young plants will need water. As soon as the first blossoms appear, cut out the staminate ones so as to leave only fruiting trees. For this purpose several plants should always be planted in a hill. A few paw paws may be planted near by on poor ground and one or two staminate trees out of those left to pollinate the others. In very dry weather the plants should be irrigated, for while they will grow in well drained soil they, at all times should be well supplied with water. If they are well grown without a check, producing large leaved healthy plants, they will in this warm climate fruit almost continuously. I have known cases of paw paws reaching an age of several years; the best fruits, however, are produced on the young trees, say one year old. Heavy crops can be grown on well-drained Everglade soil and no doubt this fruit on account of its medicinal qualities will steadily grow in demand. Should insects bother the immature fruits they can be annihilated by applications of tobacco dust.—Florida Agriculturist.

THE FEDERAL INSECTICIDE LAW.

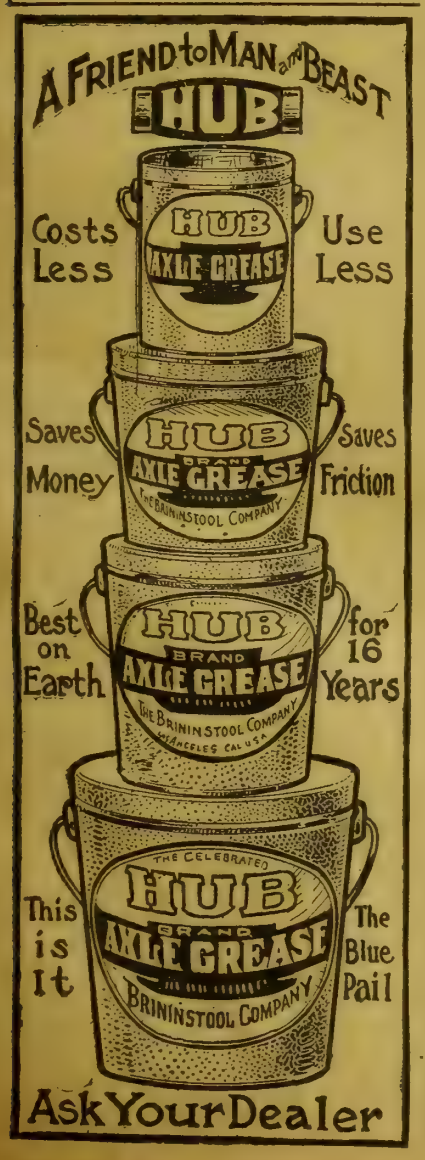
Under the provisions of Section 4 of the Insecticide Act of 1910, the Department of Agriculture is charged with the duty of examining specimens of insecticides, Paris Greens, lead arsenates and fungicides for the purpose of determining from such examination whether such articles are adulterated or misbranded within the meaning of the act, and subsequently recommending such legal action, if any, as the findings may warrant.

Sections 1 and 2 of the act are especially applicable to persons engaged in trade in the above articles in the territories and insular possessions of the United States, viz., Alaska, Arizona, Hawaii, New Mexico, Philippine Islands, and Porto Rico, in view of the fact that the manufacture or sale of any adulterated or misbranded insecticide, Paris green, lead arsenate or fungicide within the territories is punishable by fine or imprisonment. An insecticide or fungicide is any substance or mixture of substances intended to be used for preventing, destroying, repelling or mitigating any insects or fungi in any environment whatsoever. Inquiries on the part of those interested may be addressed to the Insecticide and Fungicide Board, Department of Agriculture, Washington, D. C., to whom application may be made for copies of the law and rules and regulations for its enforcement.

The Insecticide and Fungicide Board, composed of four members selected from the scientific staffs of the Bureau of Animal Industry, the Bureau of Plant Industry, the Bureau of Entomology, and the Bureau of Chemistry, was organized by the Secretary of Agriculture to assist him in enforcing the provisions of the Insecticide Act of 1910 as provided by law, and has just issued decision No. 1, relating to the subject of Insect Powders.

Bulletin 214 of the California Agricultural Experiment Station, written by Prof. H. J. Quayle, treats of citrus fruit insects. In fact, its title is "Citrus Fruit Insects." It starts in with the old and familiar pest, black scale, which has been with us for ages, touches other pests affecting citrus trees and ends with a few pages of fumigation, tables for dosage, measurement of tents, season for fumigation, etc. It is well worth the asking and citrus growers should request it at once.

Commissioner Ehrhorn of the Hawaiian Islands made an address before the San Jose Grange touching upon the menace of the Mediterranean fruit fly.



WARNING

To the Orange Grower

Insist on using only

Sulphuric Acid

made rrom Pure Virgin Sulphur when your trees are fumigated.

Acids made from waste fumes of the smelters contain arsenic, lead, copper and nitrous fumes, which are exceedingly dangerous to your trees, and may cause you no end of trouble.

MELILOTUS CLOVER

The Favorite Cover Crop

This most wonderful of nitrogen gathering plants possesses also the advantage of a deep root system which brings up the potash and phosphorus in dense soils. As a producer of humus and nitrogen for orchards it has no superior. Alkali land is made rich and productive with a few crops of Melilotus clover.

Planting season is near and the prices on our splendid, fresh, recleaned seed will be attractive to you.

We carry full stocks of all other cover crop seed—Vetch, Burr Clover, Fenugreek, Peas, Beans, etc. Write for prices and further information.

Farmogerm is a practical culture of nitrogen gathering bacteria which is easily applied and will increase a cover crop fifty to two hundred per cent. Our booklet on this subject is intensely interesting—write Dept. C for a free copy.

F. N. Hammer Manager

To the Water Well Owners and Drillers of Southern California

We beg to introduce ourselves and ask for a chance to prove worthy of your permanent confidence and patronage.

We have found that with some additions, the complete line of oil well supplies which we carry at Los Angeles and in our branch stores, is admirably adapted to supply the needs of the water well trade, and we are entering this field with all the vim and vigor which have built up our immense oil well business in the past five years.

If you are in need of an engine, pumping outfit, casing, belting, tools (small or large), pipe, fittings or supplies of any kind, we will be more than pleased to serve you. You will find our goods of the better grade only, our delivery prompt, and our prices the very lowest, consistent with first quality.

We will take pleasure in supplying any quotations or other information you may desire and will appreciate an opportunity of making your acquaintance.

Ask for our special bulletins on water well supplies. Mailed free.

J. F. LUCEY CO.

Water Well Dept. 1493-9 E. Sixth St., Los Angeles.

WHY you should have

A Likfreshing Plant

BECAUSE you can easily and cheaply convert your perishable fruits and vegetables into staples.

LIKFRESHED products are superior in every way—less loss of weight and food contents—less sulphur required. Superior flavor and keeping qualities—"Just Like Fresh." Cost of installing plant is nominal. Expense of operating is less than sun drying. For other reasons and full particulars, write or call. Be sure to look into this matter this season, as it will prove a money maker for you.

The Raisin Crop is Short

Mr. Geo. Robertson, State Statistician, Estimates a Shortage of 48,000 Tons in the World's Output This Season

The California raisin crop, which at one time promised to be a record one, was severely damaged by a late frost and from a large number of reports received from all the raisin-producing counties in the state, it appears certain that the crop will be less than in any year since 1906.

The season is late, so too early picking before the grapes are mature is likely to take place in the endeavor to avoid early rains. The second crop is generally good and may be picked and dried with the first crop if the weather is favorable, and the new acreage planted a few years ago, now increasing in bearing, will help to maintain the output. Kings county reports better conditions than some other counties. San Diego county is very short and one large vineyard in Fresno county reports Thompsons as being a good crop, but both Fresno and Madera counties report many vineyards spotted.

For the first time in the last five years the production will fall below 100,000,000 pounds. In 1894 it first exceeded that amount with 103,000,000 pounds. In 1903 the crop was 120,000,000 pounds, and the last five years the totals have been as follows:

California Raisin Crop.

Year	Pounds
1906	95,000,000
1907	140,000,000
1908	130,000,000
1909	140,000,000
1910	112,000,000
1911 estimated	96,000,000

Seedless varieties are especially short. In some cases Thompsons and Sultanas are stated to be from 50 to 65 per cent below the average. Malagas are also reported to be only about half a crop as regards raisins, but a large quantity is now shipped green as table grapes. There are exceptions and in Yolo County the crop of Seedless is reported good, but the quantity produced has fallen off on the last year or two, owing to the quantity shipped green as table grapes.

1891 the California raisin crop first exceeded that of Spain, and since then has kept on increasing, until it has more than doubled the quantity produced by what for centuries has been the leading raisin producing country of the world.

Spanish Raisin Crop.

Year	Long Tons
1907	27,000
1908	25,000
1909	30,000
1910	18,000
1911 (estimated)	22,000

The Spanish crop early in July promised to be at least 25,000 tons, but damp weather caused mildew and in July and August great heat damaged the crop, the latest advices from Denia stating that the crop will be 20,000 to 22,000 tons.

Prices in 1910.

The following were the prices realized last year for 22-pound boxes, c. i. f. American and British ports:

	First half of Sept.	First half of Nov.
Finest clusters	$4.13	$3.89
Medium clusters	3.16	2.67
Ordinary clusters	1.88	1.70
Finest loose	1.70	1.65
Medium loose	1.57	1.31
Ordinary loose	1.17	1.05

Smyrna Sultanas.

Year	Long Tons
1907	47,000
1908	45,000
1909	50,000
1910	15,000
1911 (estimated)	30,000

The Smyrna vineyards which last year suffered severely from mildew will not produce a full crop this year, but, provided the weather conditions continue to be favorable the crop will be a moderate one.

With the exception of last year, when most European crops were more or less ruined by unseasonable weather, both the Spanish raisin crop and the Smyrna Sultanas are considerably below the average.

Australian Raisins.

Both raisins and currants have been grown in Victoria and South Australia for many years, and the production is increasing, but they are mostly consumed at home, and none have been imported into the United States for several years.

Greek Currants.

The imports of currants into this country are considerable, and the quantity has not varied greatly during the last fifteen years. The crop is always a very large one, as the following summary shows:

Year	Long Tons
1907	156,000
1908	185,000
1909	185,000
1910	123,000
1911 (estimated)	140,000

Imports and Exports.

For fiscal year ending June 30, the custom returns continue to be highly satisfactory, the imports of foreign raisins showing a large and steady decrease in recent years, while the export of California raisins has greatly increased during the same period.

Year	Foreign Raisins and Smyrna Sultanas Imported Pounds	California Raisins Exported Pounds
1906	12,414,855	4,528,502
1907	3,967,101	9,128,827
1908	9,132,353	5,684,541
1909	5,794,220	7,880,161
1910	5,042,683	8,526,114
1911	2,479,220	18,659,812

The quantity of Sultanas imported is not so great as is generally supposed, the totals being as follows:

Year	Pounds
1906	7,372,568
1907	1,057,519
1908	1,638,028
1909	2,760,386
1910	2,227,884
1911	Not available

The imports of Greek currants during the same period were from 32,000,000 to 38,000,000 pounds.

The great falling off in the imports of foreign raisins is shown by the following figures. In 1894 the quantity amounted to 56,676,638 pounds. Ten years later it had fallen to 27,543,563 pounds, and last year only amounted to 2,479,220 pounds.

The exports of California raisins have increased in nine years from 2,323,276 pounds to 18,659,812 pounds.

The best foreign customers for California raisins and the pounds sold annually are:

	1906	1907	1908	1909	1910
Canada	2,697,797	6,138,010	3,663,870	5,736,290	6,086,327
Australia and Tasmania	978,860	92,427	12,275	5,400	5,600
New Zealand		1,111,555	1,216,792	1,133,495	1,323,520
Mexico	19,286	25,845	22,141	11,296	16,361
Japan	9,378	10,258	10,448	7,319	7,928
United Kingdom	2,843	8,940	3,548	8,018	2,150
Philippine Islands	2,682	589	429	1,639	6,909

Panama takes about 3000 pounds and China about 2000 pounds.

Summary.

The raisin and currant crops both of this country and in Europe were greatly below average last year, in fact in most cases the lowest on record, therefore they cannot be taken for comparison as approaching a normal crop. Compared with the year 1909, the estimated total crop of raisins this year shows a deficiency of 48,000 tons, or, including Greek currants, the shortage amounts to about 93,000 tons, as follows:

Raisins.

	1909 Tons	1911 Tons
California crop	70,000	48,000
Spanish crop	28,000	22,000
Smyrna Sultanas	50,000	30,000
Totals	148,000	100,000

Raisins and Currants.

	1909 Tons	1911 Tons
California crop	70,000	48,000
Spanish crop	28,000	22,000
Smyrna Sultanas	50,000	30,000
Greek currants	185,000	140,000
Totals	333,000	240,000

These are provisional estimates, but the final results are likely to be more or less in accordance with the above figures. Weather conditions both here and in Europe during the next six or seven weeks will determine the actual size and condition of the crop.

INVESTIGATION OF POTASH DEPOSITS.

An investigation into possible sources of potash salts in the United States is being made this year by the United States Geological Survey under an appropriation by congress of $20,000 for the current year.

One of the possible sources from which potash may be derived is in association with saline deposits left by the drying up of large bodies of salty waters, such as are known to have existed at one time in many of the now desert areas of southwest Oregon, Nevada, southeast California, in Utah, and elsewhere. It is hoped that by testing these saline deposits some may be found sufficiently rich in potash to have a commercial value, and that there may even be located some large and important deposits.

Free Analyses of Salts.

As a part of this work the Survey will soon fit up a temporary laboratory at Fallon, Nev., for the purpose of testing samples of salines from the Great Basin or desert areas.

Samples of such alkaline salts will be tested at this laboratory free of charge if a definite statement of the locality from which they were obtained be sent with the samples. The location should be given by section, township and range, if possible, otherwise by distance and direction from the nearest postoffice or settlement. Samples should be addressed to Hoyt S. Gale, United States Geological Survey, Fallon, Nev. Upon receipt of a request small sample sacks for sending the material by mail will be forwarded from the above address.

If so requested at the time that a sample is submitted for test, the accompanying information concerning the locality of the deposit will be treated as confidential; and the evidence thus obtained is not to be used for the purpose of making land withdrawals.

Bulletin Number One of the California state commission of horticulture has just been issued. It is the first publication under an appropriation made by the recent state legislature providing the sum of $10,000 for the two fiscal years beginning July 11th to be used in publishing reports, bulletins, circulars, and general information upon matters relating to fruit and kindred industries of the state. This is double the previous appropriation, and the state commissioner expresses the hope that this will enable him to give efficient aid to the fruit industry.

This first bulletin is entirely devoted to the administration of the quarantine division of the state commission, and gives the laws relating thereto. It also gives a list of the state quarantine guardians and their duties and the text of various quarantine orders. At the close of the bulletin the commissioner invites suggestions from any connected with the fruit industry as to scope and contents of other bulletins to be published.

Two gentlemen from Russia are now in California securing information as to fruit marketing, refrigeration, and transportation matters. They are Messrs. Oscar Dreier, Traffic Manager of the Riasan-Ooralsk Railroad, and C. Tihotsky, Mem. Russian Ref. Com. Deput-Russian Pr. Railroad. These gentlemen were sent to the United States by the Russian railroads to investigate transportation of perishable products by railways, and other conditions concerning fruit and other food industries.

As to fruit growing conditions in Russia, Mr. Tihotsky informed us that the apple is by long odds the leader and is the staple fruit. This is practically the only fruit produced in the north central portion of the country. North of a line drawn through St. Petersburg there are no fruits and but little of value in agricultural products. The limited population of the extreme North subsists on fish secured from the White Sea. The principal fruit growing section of Russia is about the Black Sea. The province of Kief is one of the largest apple producers and its principal apple is the Gravenstein brought to such perfection in Sonoma County, this state. These apples are shipped as far north as St. Petersburg and over a great portion of southern Russia.

The cantaloupe section of Russia is about the northern shores of the Black Sea. North and West of Odessa especially great quantities of the fruit are grown, and these are also shipped as far north as St. Petersburg.

Messrs. Dreier and Tihotsky will leave the southern part of the state for the North within a few days and will investigate as to fruit packing and shipping in producing sections and at Sacramento.

PUBLIC LAND Scrip

Scrip is an assignable right to enter land.

No residence or cultivation is required.

Rights of applicants attach immediately on filing the scrip.

Title is secured in 90 days and upwards—much more quickly than by any other method.

Will locate any land open for entry under any of the laws of the United States for taking agricultural lands.

Only way to secure title to unsurveyed lands.

Parties who have exhausted all their other rights to public land can enter more land with scrip.

Scrip can be applied on relinquished homesteads or desert entries simultaneously with filing the relinquishment, and passes the patent quickly.

HORSES.

By Mrs. M. E. Sherman.

Horses are being replaced in many lines of city work by the improved motor trucks. The San Francisco hills are no longer a heart-aching sight for a few less horses are struggling up them with heavy loads. A motor driven truck stalled on a hill only stirs the passerby to a smile of amusement at its predicament. The driver cannot work it into a frenzy of terror by shouting and laying on the whip, he is therefore usually silent in his disgust as he has no one to blame but himself for the failure. In the work of the vineyard and orchard the horse is still supreme. The flamboyant wording of the picturesque advertisement of automobile dealers frightened many farmers out of horse raising too soon, for the "passing of the horse" has not come nearly as soon as predicted. The profits of horse raising in California have never been greater than during the past five years. The prices of sound work horses is well sustained. In the heavy grade draft horses the demand has been strong at good prices.

Small Farms.

Irrigation has brought about the subdivision of the great grain ranch into small holdings. When a section of land is divided into small fruit farms, the population, human and equine, increases. More horses are required and more people are supported than on the grain farms. Under my direct observation, twenty-five years ago, was a great grain farm of forty thousand acres. One thousand fine mules put in the grain, drew the combined harvesters and hauled the sacked grain to market. This acreage is now in small holdings of twenty to a hundred acres and planted to vineyards and orchards with alfalfa patches for the family cows. At a farmers institute in the neighboring town it was asked of several men between sessions, as to the probable number of horses kept by each fruitgrower. The usual number seemed to be two work animals and one lighter horse for driving and working. Three to each twenty acres would make fifteen to each hundred acres and six thousand to the forty thousand acres of former grain farm or an increase of five thousand in the horse population. This same thing has gone on all over California and has made such a demand that the few breeders having animals on hand have profited by it largely.

Larger Horses.

The farmers at the different institutes are now talking of the horse that weighs from fifteen to seventeen hundred pounds of an active type as more economical as a worker than the former lighter horse of a thousand pounds. The tendency toward adoption of riding tools requiring three of these light horses or two of the heavier ones to handle them has increased the demand for the lighter type of draft horses. The small autorunabouts are cheap and reliable for the farmer to make his trips to town if a large machine is not desired. The ranch work horses are not in use as buggy horses on request. It is certainly easier for the horse to do only one form of work. Yet we never had as good driving horses before in the hands of the general farmers. The demand for geldings for the army a few years ago, left the mares on the farms as work animals. When a man has a fine mare, even if his farm is limited, he is tempted to find a place for one or more of her colts. The love that a faithful mare inspires makes one anxious to have her colts continue in the family. I find myself saying "Yes, Bellwood is Pet's filly, and Jean is Jeanette's filly and Jeannette was old Lady Jaynes'." They have a personality that other horses purchased would not possess. This is one of the joys of living in the country and having friends among the animals. The trotting mare of good breeding but not in the two-twenty class makes a good brood mare for producing either large sized carriage or express horses or saddlers. The mares should be selected carefully, using the smooth ones with good heads and necks, having round rumps and barrels, with long pastern joints for breeding, for driving and saddle animals. The rougher mares are good dams for draft grades. The things most to avoid in selecting a brood mare are spade feet, cat hams and any form of bone disease, as splavin, thoroughpin and like troubles, which may be transmitted to the colts.

Morgans.

The United States government is buying Morgans to again build up a strong stud of this strain of horses. The farmers crossed many of these good Morgan mares with ill-shaped horses of trotting strains of any sort of breeding. The craze for speed! speed! speed! nearly lost the Morgans, the best type of light horse we have ever had in this country. The automobile we often think brought about the love of going, but it only intensified the American desire to get there at once. The Morgans are a hill race of horses and do wonders. It is not uncommon in the hill country to drive fifty miles a day in a heavy buggy with a single animal day after day. My uncle had an old mare bought in New Hampshire of a celebrated Morgan strain. This old mare had two daughters, one a pure Morgan and the other by a Hambletonian sire. It was twelve miles to Westchester and the Hambleton-Morgan mare used to take the spring wagon with uncle and me around the curves, and over the stones and "thank you marms" in a short hour and back again with the load of farm supplies. Once the seat tipped and we rolled out of the back of the wagon. The Hambleton went on straight as an arrow home without spilling anything else, to the hitching post at the side door of the house. The Morgan mare was not as speedy as her sister, but was gentler and of more loving disposition. She had great endurance and was used by the women of the family on the long trips across the country of thirty or more miles to spend the day with Friend Supplee, or Friend Darlington, or some other good old Quaker family. The family carry-all often had four grown people with children in the cracks to its full capacity, the long miles were reeled off going and coming with ease by this little nine hundred pound mare with legs of steel and back of iron. Year after year of this endurance test these mares stood until twenty years later when I last saw them, they had the sunken eyes of age, and yet not a blemish on the legs or any other signs of age. The Hambletonian mare was totally deaf from lightning that had run down the barn deflected along the iron holding rod of the manger during a terrible thunder storm.

The offspring of the Hambletonian sire Electioneer gave many large-sized horses of good red bay to this state. The farmers tried to raise something fast but got instead some of the best carriage horses and work animals. These horses weigh from twelve hundred to sixteen hundred and many of them show Roman noses and pigeon toes as a race mark. Many of these excellent horses have great strength and vigor with good style and flat-boned legs but are not sweet-tempered as a rule. Many of them cannot be handled by poor horsemen, as they try by snorting to bluff out a timid man. Petting they are indifferent to, but if one respects their great ability to go and promptly calls their bluffs, they make fine carriage horses. They cannot be surpassed for level-headedness on the road, taking care of themselves and the family in their own sour way. They remind me of some people that are said "to do the kindest acts in the unkindest

way possible." Now please do not say that I think all Hambletonian horses are like this, but the thirty-four I have owned were all sullen as they grew old. I have one today that I have had almost constantly in use for twelve years that will not accept anything from my hand, but looks at me with a snort. He is the only one that is that bad, the others merely chill my budding affection for them with a cold glance.—M. E. Sherman.

ROYALTY AND NOBILITY TO VISIT CHICAGO.

Blue Blooded Guernseys for the National Dairy Show.

An extremely interesting thing is to take place at the National Dairy Show in Chicago this year. It is no more nor less than a contest between the breeders of the United States and the cattle experts of England as to which country has the best judges of dairy cattle. This international rivalry has never been settled. Year after year American and English fanciers visit the Guernsey and Jersey Islands and return with their importations. These animals easily win in their classes in each respective country, but have never competed internationally, so it has always been a question whether Englishmen or Americans are the best judges in the selection of prize winners.

About a month ago an intimation reached Chicago from a few representative and, incidentally, titled breeders of England that they were ready to try conclusions with their American brothers; it being suggested that the matter be settled in the ring of the National Dairy Show in Chicago next October. This was promptly agreed to by the officials of the exposition, who realized that this would be the greatest case tried in their "court of last appeal" for the world's leading breeders.

News of this international competition has spread among the American breeders, and there is the same determination to win as is in evidence here when we build our cup defenders for the international yacht races.

SAVING BY CO-OPERATION.

The saving effected by the Litchfield co-operative livestock association in the marketing of hogs has averaged about 50 cents per hundred weight, as compared with sales effected outside the association. If all the livestock of the state were sold on a similar basis, it would mean a saving to the producers of about $1,500,000 annually. But this figure refers to the product of livestock under present conditions only. The business of stock raising is still in its infancy in Minnesota. Next to dairying it is destined to be, probably, the largest agricultural interest in our state. Destiny so writes in the fact that the grasses and feed-crops, which are the basis of all successful animal husbandry, here find their natural home, their richest development. Therefore, efficient organization among stock raisers means the saving to them not merely of $1,500,000 annually, which now goes into the pockets of middlemen, but of many times that amount when, as a stock growing region, Minnesota shall have "come to her own."—C. R. B., University Farm, Minnesota.

This is the Simplest, Most Durable and Easily Handled Traction Engine on the Market

The drawbar pull of this engine is equal to that of 12 horses. When used as a belted engine, 25 H. P. can be developed. It is well adapted to Threshing and Hay Baling.

CALIFORNIA WILD FLOWERS.

(Continued from Page 217.)

Clevelandi) is a very pretty little plant with fragrant flowers in shape like the cyclamen and varying in color from delicate lilac to pure white. The petals are ringed at the base with pale yellow and the beak of the flower is violet purple. The plants are easily grown and transplant well, but require plenty of water.

Lobelia splendens is found in wet places and along streams in the upper portion of the chaparral belt of our mountains, grows two to four feet high and produces long spikes of cardinal red flowers. The Columbine (Aquilegia truncata) is also found along streams. The flowers are deep scarlet, tipped with yellow; plants grow two to three feet high and have slender, graceful stems with beautifully escalloped leaves. The two foregoing species would both require plenty of water, but are certainly worthy of cultivation.

The Matilija Poppy (Romneya Coulteri) is of course cultivated to some extent, but should be more generally bush grows from four to eight feet high, has graceful willow-like foliage and bright yellow flowers, two to three inches in diameter, in shape and color almost like the Hunnemannia fumariaefolia of our gardens. It blooms nearly all the year round, but it is at its best in early spring. I found a magnificent specimen in the San Fernando wash. The bush was about eight feet high, and had over five hundred blossoms on it.

Of the Ceanothus (California Lilac) there are many species worthy of cultivation in our gardens, but will simply mention one of the most desirable here, Ceanothus divaricatus, which has large clusters of pale blue fragrant flowers. In early spring when in full bloom this shrub presents a most charming appearance on many of our hillsides, with its long sprays of delicate pale blue flowers.

The Fremontia Californica, (California Slippery Elm) found by General Fremont when crossing the Sierra and named in his honor, belongs to the Sterculia family; grows from four to fifteen feet high, and reaches its

VIOLA PEDUNCULATA

appreciated. It has often been termed the Queen of California flowers, and is truly a majestic plant. The blossoms are often six or seven inches in diameter, pure glistening white with yellow centers.

One of the most handsome of our native flowers is the Wild Wallflower (Erysimum asperum) an erect growing plant, two to four feet high, producing long spikes of large orange-colored flowers.

A valuable plant for dry banks is the California Fuchsia (Zauschneria Californica). It has woody stems and gray green leaves covered with soft wool. The flowers are trumpet-shaped and of a vivid scarlet color. This plant grows on dry banks, and is remarkable for its very free flowering qualities.

Solanum Xanti (Violet Nightshade) also grows in dry sandy situations. The plants are of shrubby growth with rich green foliage and clusters of violet blue flowers. Solanum Wallacei is a handsome species which grows on Catalina Island. It has rather heavy, wooly foliage, and deep violet flowers.

Another shrubby plant is the Venegasia carpesioides which forms quite a bush, often six or seven feet high, with an abundance of large, glossy, bright green leaves and flowers in shape something like a Marguerite, but of a pale lemon yellow color.

Shrubs.

One of the most beautiful of all of our native flowering shrubs is the Dendromecon rigidum, or Yellow Tree Poppy. It is very hard to propagate, however, and for this reason is not likely to be generally cultivated. The greatest perfection on the desert side of the mountains. It flowers in early summer and the bushes are simply a mass of golden yellow flowers two to three inches across. No more glorious sight can be imagined than a mass of these shrubs in full bloom. It has been cultivated in Europe and to some extent in California, but is not generally known.

A most exquisite little shrub found in the canyons bordering on the Colorado desert is the Dalea spinosa. The flowers which appear about May are pea-shaped, and produced in great profusion. The color is the richest shade of dark blue I have ever seen in any flower.

Almost anywhere in our foothills can be found the Sticky Monkey Flower (Mimulus glutinosus) or Diplacus longiflorus as it is termed by some botanists. This shrub grows from two to five feet high, the flowers remind one of an azalea, and are usually of a deep, rich orange color, though there is a deep crimson form which grows in the mountains near Chatsworth Park, and also many intermediate types. I have also found plants with pale cream colored flowers. This shrub will grow without any irrigation, but the natural rainfall, and flowers for the greater part of the season, but especially in spring when the plants are simply a mass of bloom.

Another shrub equally worthy of cultivation is the Encelia Californica, this has yellow flowers something like a single sunflower, it blooms abundantly, the flowers are on long stiff stems, and last well when cut, and will grow in any dry place.

White Lead on the Farm—*Vehicles*

You can't afford to neglect painting your farm wagons. A few small cracks will let in the weather, the wood will begin to rot, the timber to weaken, and a break-down will follow. *Neglect ruins more wagons than over-weighting.*

Good old-fashioned paint made of

"Dutch Boy Painter"
Pure White Lead

and pure linseed oil is what wagons need. It holds to the wood like a nail and fills every crack and crevice. The surface of the wood is protected against moisture until the paint is actually worn away.

Our Free Painting Helps. We will send you free on request color schemes and miscellaneous painting instructions. Ask for Helps No. 2826

Another cotton seed oil mill is in contemplation for the Imperial Valley.

I know of two ladies in Hollywood who have a number of native shrubs in their garden, among others one fine specimen of the common Greasewood (Adenostoma fasiculatum). When in flower many people have stopped to admire it, and have asked the name of

DELPHINIUM CARDINALE

it, and yet within less than half a mile there are hundreds of acres covered with this shrub. In May many of our hillsides are white with the blossoms of this plant. It flowers in large feathery panicles, and reminds one of the blossoms of the cultivated Spiraea Japonica.

A common evergreen shrub in our foothills is the Fuschia flowered gooseberry (Ribes speciosum) and is well worth cultivating in our gardens. It transplants easily and can be propagated by cuttings, grows four to eight feet high and is of spreading habit. The stems are furnished with triple thorns and also thickly clothed with rich red hairs; leaves three lobed, rich green; flowers about an inch long, rich cardinal red, hanging in long sprays much like a fuchsia.

Ribes tenuiflorum is a beautiful yellow-flowering currant. It forms large bushes which are covered in early

CASTILLEJA MARTINI

spring with immense quantities of light yellow flowers. A beautiful shrub for very dry places is the Romero or Wooly Blue-curls, (Trichostema lanatum). It has flowers in spikes often a foot or more long, of a rich blue color.

Pentstemon antirrhinoides also grows in dry places. It is a handsome bush species with narrow leaves and numbers of very large, canary yellow flowers. Another very pretty flowering shrub is Berberis Nevini. It has very prickly foliage, and long sprays of rich yellow flowers.

The Yellow Tree Lupine, (Lupinus arboreus) is found on sandy mesas. It grows from four to ten feet high, has rather silvery foliage and large canary-yellow, fragrant flowers. It would be especially valuable for beach gardens, as it will grow in pure sand. Indeed it has been said that this and another species of Lupine were found most valuable near San Francisco for anchoring the shifting sand dunes. The seed was sown with barley which growing more rapidly, protected the plants when young. In one year the lupines had covered the sands with a thick growth two to three feet high, enough to prevent them shifting during heavy storms and to allow the planting of other trees. In this way was made possible the laying out of the beautiful Golden Gate Park of San Francisco.

The California Holly or Christmas Berry (Heteromeles arbutifolia) is of course well known to all and greatly admired. It is a beautiful shrub and well worth cultivating, both for its handsome foliage and attractive berries.

Another shrub with showy berries is Rhamnus crocea, a low, thick, much branched shrub with small leaves and insignificant flowers, but producing immense quantities of rich scarlet berries.

The Cascara Sagrada or Wild Coffee (Rhamus Californica) is well known and may be mentioned here as worthy of a place in our garden.

Two evergreen shrubs especially desirable for their handsome foliage are Rhus laurina (Sumach) which grows in compact form, has smooth green foliage and clusters of small white flowers, and Rhus ovata (Lem-

BRODIAEA COCCINEA

onade-and-sugar-tree) as it has been called on account of its acid berries which are coated with a sweet, sticky substance. The foliage is large, rich bright green and leathery. This is one of the most handsome shrubs imaginable and should be very extensively grown. Both of these species grow in very dry places and would be particularly valuable for dry banks and places where water is scarce.

Juniperus Californicus is a dwarf spreading species found in some of our dry sandy washes and could be used to advantage in many gardens.

A splendid shrub either for single specimens or for hedges is the Wild Cherry (Prunus illicifolia). It has pretty, glossy, holly-like foliage and small white flowers. Last Christmas large quantities of the foliage of this shrub were shipped into San Francisco and Los Angeles and used for decorating, much of it being made up into wreaths and sold by the florists. It apparently found ready market, but few people, even those who were handling it, knew what it was.

Trees.

Perhaps the most familiar of our native trees is the Live Oak. Still for beauty it has few if any rivals. Quercus agrifolia is the most common species, and is known by nearly everyone, but there are others equally worthy of cultivation.

The Golden Cup or Canyon Oak (Quercus chrysolepsis) is plentiful in the canyons of our mountains above 2500 feet elevation. It forms a magnificent tree of large size; the foliage is smaller than the common live oak and of a slightly different shade of green, and the acorns and cups are of

PRODUCE MARKET.—Los Angeles Market; San Francisco Market; Deciduous Market; Citrus Market; 236, 237.

SUBDIVIDED.

Almost every week brings to notice some new subdivision of lands in the Sacramento and San Joaquin Valleys. These valleys, especially the northern one, have been cursed with large ranch owners who insisted upon holding great tracts of land either as stock ranges or for hay or grain raising. Instead of being farmed on the intensive plan, they were farmed on the most extensive one, and sometimes with material profit to the owners. But such great tracts have kept back the growth and withheld opportunities from the small landowner. Some of these great ranches were in the most fertile sections and their subdivision will make place for many thriving communities and greatly increase the wealth of the state.

INCREASE OF SUGAR OUTPUT.

California's sugar production will this year break all records. In the first place the quantity will be in excess of any previous year, and again, the sugar content of the beets is higher. One feature of the increase in value has been the drying of pulp which has heretofore been placed in silos or sold fresh to stock feeders. This will enable longer transportation and the saving of a most valuable by-product of the sugar factory.

The increase is peculiarly gratifying because the total sugar output of the United States will be much less than heretofore. Unfortunately under existing conditions the increase in price within the last few weeks will not be realized by the beet producers. It may. however, give an advantage to the farmers in enabling them to secure more favorable contracts for next year's output.

VALUABLE REPORT.

It may be somewhat late, but we must refer to a county horticultural commissioner's report giving to his constituents accounting for the past year's efforts. It is that of Mr. E. O. Essig, of Ventura County, and is the most complete county report we have ever seen. It is a pamphlet of 64 pages, fully illustrated, and records the work of the year July 1, 1910 to June 30, 1911. This is the second annual report and was first given to the producers of the county at an annual fruit growers meeting held at Santa Paula, June 29th. The best part of Mr. Essig's report is that it is not merely an enthusiastic presentation of possible work by the commission, but a clear statement of work done, and better, information as to aiding in keeping the various insect and fungoid pests from the orchards of Ventura County.

INCREASING PRODUCTION.

The gathering of cotton in the Imperial Valley has reached the stage where it is evident the average production per acre will be materially in excess of any preceding year. It is too early to give exact figures, but the fact that there will be some increase is gratifying. The increase will not reach the amount promised by some cotton enthusiasts early in the game, but there has been such a wide difference between actual production and enthusiasts' promises that it will afford opportunity for improved cultural methods to be brought into use for some time to come, but it is no wonder that production has not yet come up to predictions, for it must be considered that California is young in cotton producing and that conditions here are as absolutely different from conditions in the South as daylight is from dark.

With the weeding out of the careless growers and use of only those methods which have brought best results, will come an increased production year by year which, we believe, will make California a reputation as a cotton producer. In this achievement long staple cotton will play a leading part.

A BIG BUSINESS.

Farmers often look at masterful handling of large business ventures and sometimes feel restive under the small operations which seem necessary in their chosen line, but we may be permitted to call attention to the fact that in the aggregate they are responsible for the world's greatest industry. Farm lands in the United States, exclusive of the buildings on them, were valued in 1900 at $13,058,008,000. This immense valuation was more than doubled during the decade ending 1910, or to be exact, these lands had increased in valuation to $28,386,770,000. This was an increase of 117.4 per cent. The increase in valuation was not equalled by the increase in acreage of farm lands, for that was only 4.2 per cent, consequently this great increase in aggregate value was almost entirely upon the lands already under cultivation in 1900. This increase brought down to the acre was from $15.57 in 1900 to $32.49 in 1910. Probably this increase was caused more by the general advancement of the prices of farm products. Another factor is that the farmers are prone to figure their interest returns at a lower rate than formerly, that is. at a lower rate upon investment in the farms than was considered acceptable a few years ago. Another cause of increase is the draining and full reclamation of swamp and other lands which were partially tilled before and have been brought under intensive cultivation by tiling, diking and other methods.

STATE APPLE SHOW.

The Watsonville boosters are making a far greater effort for a big show than last year. At that time "Watsonville Apple Annual" was the slogan. Now the idea is to have a more general representation amongst exhibitors. A representative of the association is now in the southern part of the state endeavoring to line up every section which can produce apples and secure an exhibit which shall be truly representative of the entire state. Already eleven entries have been made in the full carload class and it is expected to exceed last year's 15 entries. The cash prizes offered are aiding in this matter, but the $100 prize for the best car will hardly compensate for the outlay. The credit for producing a first prize car will be a long suit in the market with any shipper or community. Next to the car lot entries the 100 box exhibits will draw a $100 first prize. For the 50 box lot class $60 first prize is offered; for 15 box lot, $40; for 10 box, $25; 5 box, $15; 1 box, $10. Plate exhibits follow with silver cup, and even a silver cup is offered for the one largest apple.

Many prizes are offered for cold storage, evaporated, cider vinegar, canned, bottled, and domestic by-products. Feature exhibits will also be a big factor. The first prize will be $200, second $125, third $100. The feature exhibits have been under discussion and at one time it was thought they would be cut out and a straight quality requirement considered, but to please the ordinary show visitor the features are a strong factor, and we doubt not that influenced the committee in retaining them.

Watsonville says that "The Apple Show Where Apples Grow" will be a hummer, and extends an invitation to every section of the state to be present.

BUY WHOLESALE

We recently overheard two livestock men at the state fair discussing the matter of feed, and one raised the point that in his particular neighborhood, far from the railroad, he was able at this time to buy wheat even cheaper than barley, and said that he was buying and feeding wheat in preference to barley. We doubt not he is one of the shrewder men of the earth who are bound to succeed and who is closely watching market conditions along the line in which he is most deeply interested. We believe there is one of the greatest factors of success in the farming operations. The farmer grows so wrapped up in the interesting processes of production that he fails to watch the market end as he should, buys at too large a price and sells at a price which prevents reasonable profit. It must be confessed that the problem is a big one and many farmers fail to view it from all sides. Therein lies the advantage of co-operation. The few successful co-operative marketing organizations in this state should be an inspiration to growers to place their products in the hands of those who can devote their time and have the ability to attend to the purchasing and marketing as it should be done. Then the producer can devote his energies to production. In any case, he should not buy from hand to mouth, for even in the poultry business we believe there have been many failures because of not looking ahead and purchasing supplies in a large way when they may be cheaply secured. Such producers must be careful or they will buy at retail and sell at wholesale, and no producer on earth can do that and make a success.

California is not alone in securing improved varieties of wheat. A bulletin of the Iowa Experiment Station reports the work of that station in selecting and breeding fourteen new varieties of winter and spring wheats which have been developed in that section. Regarding the entire list of fourteen varieties the bulletin says: "Without exception they are expected to prove very satisfactory for Iowa conditions. 'They have yielded as high as 51 bushels per acre and none less than 40 bushels.'" This production was in face of the drouth conditions of this season, one of the most severe in years.

The Secretary of State has registered 1699 auto vehicles for the month of July. Surely the automobile business in California must be increasing at a rate which will soon make California, instead of the second chug wagon state in the Union, the first.

It is encouraging to note reports from this year's output of California wheat in effect that it shows a great increase in gluten due to improved quality of seed through selection during the past few years of careful wheat testing.

Ferndale Fair is being held this week.

Agricultural News Notes of the Pacific Coast

Northern California

Butte County's fig crop will be heavy this year.

Hop picking in Sonoma County is now in full swing.

The sugar factory at Hamilton is turning out 1600 sacks of sugar daily.

Placerville, El Dorado County, is shipping about six cars of peaches daily.

Carlots of sweet potatoes are being shipped from Knights Landing, Yolo County.

Los Molinos, Tehama County, has a large force of men extending canals and laterals.

The Madeline Irrigation Company of Lassen County is planning a new irrigation system.

It is estimated that the state will produce about 100,000,000 pounds of prunes this year.

Davis is puffed up over the fact that it shipped the first car of almonds out of the state this year.

Napa County claims the first car of prunes for the year, having shipped one on September 1st.

The cannery at Santa Rosa, Sonoma County, is unable to handle all fruit because of help shortage.

A forest fire of incendiary origin caused the burning of large acreage near Placerville, Eldorado County.

Yuba County reports one-half of its hop crop gathered. Picking machines have been used on only one ranch.

It is said that over 30,000 people attended the races at Sacramento on the day of the $10,000 Governor's stake.

Woodland, Yolo County, is paying $13 per ton for wine grapes. The season is about two weeks later than usual.

Seventy-five Chinese and 100 Japanese are busy gathering the grapes of the great Vina Ranch in Tehama County.

The Chamber of Commerce of Haywards is making strenuous protest against removal of the state game farm to Folsom.

Vacaville shipped 731 cars of green deciduous fruit up to the last of August. This was about 160 cars short of last year same date.

The warm weather of the past two weeks has been acceptable to grape growers of Sutter County and the fruit has sweetened and colored measurably.

Several high priced hop picking machines were destroyed by fire on the Horst Ranch at Bohemia, Tehama County. The loss is estimated at $100,000.

With the other "finest apple producing section of the world" districts Placer County claims place, especially as to lands in Dutch Flat, Towne and Alta sections.

The Winters Canning Company's plant is not handling the usual quantity of Yolo County fruit, but its quality is said to be superior to that of any preceding year.

San Francisco received last week a cargo of 3627 bales of narcissus bulbs said to be practically the entire crop of Japan. This is the first time American buyers have been able to corner this crop.

Central California

The picking of raisin grapes began in Tulare last Monday.

Stockton wineries are paying about $10 per ton for Zinfandels.

Over 21,000 melons were eaten during the carnival at Turlock last week.

Picking of Muscat grapes is now being pushed in all portions of the valley.

A large fruit packing house was partially destroyed by fire in Fresno last week.

Fresno is making an effort to secure the 1915 meeting of the National Irrigation Congress.

Some 1500 acres of timber land on the north fork of the San Joaquin have been destroyed by fire.

A large tract of land near Madera has been purchased and will be subdivided into small ranches.

Kings County Fair Association has leased most of the concessions for its fair to be held September 25-30.

It is expected the new state highways to be built with the $18,000,000 road fund will cost about $10,000 per mile.

Prunedale, Monterey County, has practically all grain sacked and will begin bean harvesting within a few days.

Owing to the lateness of Muscat grapes and the continued cool weather growers are much concerned over raisin drying.

The Pajaro Valley apple growers are manifesting much resentment over the location given their exhibit at the recent state fair.

Cool weather during the last of August caused Malaga grapes to ripen rather slowly and compelled packing houses to close for a time.

Grape growers of Kerman, Fresno County, have pooled their interests and the possibility of handling large quantities has attracted several buyers.

The state engineer's office is investigating conditions of the San Joaquin River with a view to making recommendations as to river traffic to Fresno.

A large number of grape growers of the Turlock district recently held an enthusiastic meeting and decided to pool issues in the marketing of grapes.

Grape shippers have decided to make a comparatively low price on all earlier shipments and thus cause as big demand for California grapes as possible.

Orosi, Tulare County, is developing quite a melon seed industry. Her seed is selling for 21 cents per pound and some growers have cleared as high as $100 per acre.

Tulare County has served its first notice to land owners to eradicate the squirrel pest. Complaint has been filed against a non-resident property owner whose residence is in Los Angeles.

The contract of the Lodi grape growers called for a price of $25 per ton for August delivery and $18 for all later deliveries. Owing to the cold weather the crop ripened so late that but very few were marketed at the higher price.

Southern California

Riverside is taking steps to install a county fair.

Anaheim cannery started on tomatoes on September 5th.

Anaheim is planning for a carnival September 27-October 1.

San Bernardino has a Pekin duck which has built its nest in a tree.

Imperial Valley barley growers are selling in the neighborhood of $1.45.

The Driving Club at Hemet, Riverside County, is holding a harness meet this week.

San Bernardino County horticultural commission has 21 inspectors constantly in the field.

The Anaheim Sugar Factory is making good with its first season's run. It is now handling 22 to 26 cars daily.

A large ranch near Santa Maria, Santa Barbara County, will be subdivided and sold in small holdings.

It is estimated that the 1911 output of grapes in Southern California will be twenty per cent above normal yield.

The first car of oil from the new cotton seed oil factory at El Centro, was received in Los Angeles September 1st.

The Hemet Deciduous Fruit Growers Association has voted to disincorporate and reincorporate as a stock company.

San Fernando Valley in Los Angeles County planted extensively of black eye beans this year and found it very profitable.

Some San Bernardino County growers are protesting against the Johnson grass pest and maintain that the law is not being enforced.

Orange County's four sugar factories are unable to handle all its output and some beets are being sent to Oxnard, Ventura County.

The collector of internal revenue in Los Angeles estimates that the total output of sweet wine in Southern California will be 4,000,000 gallons.

The Lima bean crop at Sawtelle, and Palms, Los Angeles County, will be almost double that of last year. That section will produce about 13,000 acres.

With a better understanding of cotton growing requirements Imperial Valley claims a much better output than last year; over 16,000 acres are ready for the harvest.

The big Waters Cannery at Pomona is making a record of 50,000 cans daily. This amounts to four cars of canned fruit every day. The average price being paid for the green fruit is $25 per ton.

Beet growers of Orange County are engaged in the quest of a sugar beet weighing 26 pounds. It is claimed that one weighing 26¼ pounds was found, but before it was understood that it was needed for exhibition purposes it was sent through the slicer.

The experiment station in Imperial County on this side of the Colorado River near Yuma, has made many experiments in long staple cotton growing and sufficient information has been secured that it is safe to predict that the ordinary cotton in California will ultimately give way to the long staple varieties.

The Coast

Medford, Oregon, has shipped 23 cars of Bartlett pears.

Idaho's total assessed valuation amounts to $330.000,000.

The great apple show at Spokane will open on November 23rd.

The first annual agricultural fair is being held this week at Wilcox, Arizona.

Yakima County, Washington, is planning a million dollar road bond issue.

The Fourth Annual Peach Festival was held at Freewater, Oregon, last week.

Lincoln County, Washington, is averaging 25 bushels to the acre of wheat.

Wenatchee, Washington, is shipping about 20 cars of fruit daily, mostly peaches.

Walla Walla, Washington, is claiming an average of 53 bushels of club wheat per acre.

Threshing returns of Eastern Washington show wheat running from 25 to 60 bushels per acre.

The Spokane County fruit growers will market their fruit through the Yakima association.

Watermelon growers at Wapato, Washington, have shipped 70 cars to various Sound points.

One alfalfa seed producer at Yuma has marketed over 600 pounds to the credit of a 20-acre ranch.

Farmers of Wilcox, Cochise County, Arizona, are discussing the matter of co-operative marketing of products.

The Farmers Union Warehouse Company at Goldendale, Washington, is shipping all its products by water.

Three counties of Eastern Washington claimed a shipment during 1910 of 3018 cars of fruit, 2400 of which were apples.

A great tract of land in Bonner County, Idaho, will be drained and made tillable through a system of pumping.

Alfalfa seed producers near Yuma are marketing a big crop. 20,000 pounds were delivered at Yuma on one day last week.

Nearly all of the $23,000 appropriated by Congress to relieve fire sufferers of the Coeur D'Alene district has been disbursed.

The sugar factory at Lehigh, Utah, begins operations this week. It is expected the factory will have an output of about 100,000 tons.

Pacific County, Washington, has no rival in the West in the production of cranberries. One grower will have a crop this year which it is estimated will net $100,000.

A hybrid wheat developed on experiment grounds at Pullman, Washington, produced this year at the rate of 57 bushels to the acre.

Spokane, Washington, eats 100 cars of onions more than are produced there and there is a feeling among the farmers that they should raise that 100 carloads at home.

Effort to reclaim 50,000 acres of swamp land known as the Klamath Marsh in Southern Oregon and Northern California have been abandoned because of the large content of alkali.

At Certain Seasons Feed Certain Things

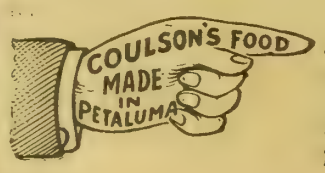
At this season, whan we are approaching the period of high prices for eggs, you should feed

COULSON'S EGG FOOD MADE IN PETALUMA

It contains a varied assortment of ingredients which the hen requires. We have studied the problem and spared no expense to give to our

Egg Food

all the properties which are conducive to extensive egg production.



A trial will convince you that we have the product you have long been looking for.

Egg-More

The biggest egg producing food made. Not merely a strong tonic, which is not advisable to be fed regularly, but a FOOD, highly concentrated and very rich in protein. EGG-MORE mixed in proportion of one pound to 6 lbs. of good ground grain feed will keep the fowls in good health, maintain a strong and vigorous system, make the hen molt early, feather out quickly and convert the protein into eggs. It has been doing just that for six years, and each year the sales have greatly increased. It is the biggest selling poultry food on the market today. 4 lb. package, 35c; 12½ lb. sack, 90c; 25 lbs., $1.65; 50 lbs., $3.00; 100 lbs., $5.50. We pay freight within 200 miles on sack of 25 lbs. or over. Send for EGG-MORE BOOKLET.

West Coast Seed House

111, 113, 115 Winston St., bet. 4th and 5th, near Main, Los Angeles

Profit in the Poultry Yard

Practical poultry people who may have ideas from their experience as to methods of feeding and housing and general care of poultry will confer a favor upon the Cultivator and its circle of readers by sending in concise accounts. Mrs. Basley is always willing to answer queries, which with the experience of others should make this a most valuable feature in poultry life on the Coast. Opinions or matters of a personal nature should be omitted, but a concise statement of facts is always valuable.

ADVANTAGES OF TRAP NESTS.

It has been learned by means of the trap nest that many hens rarely, and sometimes never, lay a fertilized egg. By marking each egg that is intended to be used in incubation with the layer's leg band number, those hens which lay nonfertile or weak-germed eggs, can be detected, and their eggs avoided.

It is no new discovery that the hens which lay well during the fall and winter months are the ones that pay best from the market-egg standpoint; but when we analyze the detailed egg-records of several hundred individual hens, recorded by many different trap-nesters, we find that the best fall and winter layers are also, as a rule, the best summer layers. By "best winter layers" we mean the individual hens that lay from twenty to twenty-six or twenty-eight eggs per month; we learn that the genuine "persistent layer" as an individual is pretty certain to lay prolifically the year 'round.

Poultrymen who have never handled the individual hen as a unit, but judge the matter wholly by the records of flocks as a whole, have frequently claimed—and have found apparent reason to support the claim, that the type of hen which lays well in winter is not the type that lays well in summer; but trap-nest records of flocks that have been competently handled for eggs all through the year do not support that theory. The hen that does not lay freely and profitably in summer when properly handled, does not, as a rule, show up on the trap-nest records as having laid remarkably well, either the previous or following winter. There are exceptions, of course, but they are relatively few. It is a most excellent idea to keep the stock carefully culled of drones and moderate layers, all the time, summer and winter. It is the "persistent layer" that pays the year 'round profit in market eggs, and she is the true "laying type" that trap-nesters count upon to perpetuate the prolific-laying habit in their stock.

Summer has its own peculiar conditions that antagonize egg production, and the profits are shrunken unless the adverse conditions are overcome. The "strictly fresh egg" is always in demand, but eggs which are allowed to remain in a hot nest, covered by sundry hens that visit the nest throughout the day, lose considerable of their first freshness by night; whether the eggs are to be incubated, marketed soon, or held in storage for future marketing, their quality has been lowered. Trap-nesters remove the eggs from the nests from three to five times during the day; as a rule the trap nest is an individual nest, and the layers are not able to crowd two, three or more at once upon a nest of eggs, overheating eggs and hens, both, as is frequently the case where the ordinary box nest is used.

Then, again, trapnesters have found by experience that summer troubles with broody hens are greatly lessened by judiciously handling the traps. The frequent handling of the layers and prompt removal from the nest seems to diminish their brooding inclinations, and they are more easily "broken up" when they do become broody. Many persistent layers in the incubating breeds do not become broody at all when using the trap nests, but continue to lay right through the summer. "Egg eating is a vice practically unknown where these nests are used," is the report of many who have had long experience with good trap nests.

It is an interesting fact that quite a number of the most successful trap-nesters installed and began to use trap nests during the summer months. By fall they had become quite familiar with their use, and were in a position to exercise good judgment in trap-nesting and culling the pullets, and the yearling hens through the molting period. It will be found that the great layers are remarkable for a tendency to molt without apparent loss of vigor, and they will continue to lay during a considerable portion, or the whole, of that period.

It certainly is an excellent plan to get the trap nests installed during the summer months, become familiar with handling them without loss of time, and then one is prepared to start the new generation of layers upon the right road.—Coleman's Rural.

WATER FOWLS.

Wonderful improvement has been made in this class of fowls within the past 20 years. It is a class that seems to receive but little attention from the rank and file of poultry breeders. It has supporters, however, who are putting in their best licks with the breeds they handle, and as above indicated, they are making tracks that are easily seen.

It has not been many years since about the only thing found in the way of geese was the proverbial old white and gray ones, scarcely larger than a Plymouth Rock hen of today. The same was true in ducks; the old-time puddle duck was in the swim, and nothing else appeared upon the pond. But how is it today? If you want to investigate a little down the line just take a trip through the Middle West or Southwest where water fowl breeding is carried on to a degree worth noting and visit a number of the state and county fairs in those sections and take a look at the water fowl exhibits. In the place of the old-fashioned crumpled-winged scavenger of your father's or grandfather's horse lot that you may have visions of yet, you will see the lordly dark gray Toulouse and the pure White Embden, and the Gray African, which weigh as high as twenty pounds, and as one visitor I heard expressed himself, "Why, they are as big as cows."

They are wonders when we stop to think about them, and that they are all the result of man's work and skill. The Toulouse and Embden have thick, short necks, and long, deep bodies, while the African has a long neck with a broad head surrounded by a large round knob, with a heavy dewlap on the throat. They are all heavy, weighing when fully matured, 18 pounds for goose, and 20 pounds for gander.

Then we have in addition to these the Brown and White Chinese and the Egyptian, all much smaller in size, but bred to a high point of perfection and egg production. The Chinese are

rather short and rounded in body, with long, slim, gracefully arched necks. The head is slim, with a large, well-rounded knob on the top. This makes rather a peculiar looking, but attractive and fancy fowl. They make a very showy fowl for the farm with the pond or lake, or the city park.

In ducks you will find twelve different varieties represented. The prominent large ducks are the Pekin, and Aylesbury, both white; Rouen, a beautifully colored duck similar in colors to the wild Mallard; Muscovy, in white and colored. These ducks attain to the weights of 8 pounds for duck and 9 pounds for drake when fully matured. Think of these taking the place of the ducks of old that could hardly be found to weigh half that much.

The Pekin and Aylesbury are used principally for the big duck markets, where they are raised by the tens of thousands.

The Cayuga and East India are medium sized black ducks, bred but little except for variety and show purposes.

The Gray and White Call, and Blue Swedish, are the small ducks, but are good layers. The Crested White is bred for the ornamental top-knot or crest which adorns the top of its head. It is, however, of good size and is all right for market purposes.

The Indian Runner is the latest achievement in duck circles. It was imported from the north of England but a few years ago, and has proven to be a great layer. It is slim and active in its make-up and occupies the position among ducks that the Leghorn does with chickens. In fact, a good many remarkable laying records have been brought out. Truly the range of variety in type and color in both geese and ducks is wide enough to satisfy all comers.—Southern Ruralist.

SOME POULTRY TERMS.

There seems to be a somewhat hazy notion among amateurs as to the exact meaning of the terms used to designate young and old stock. A pullet, strictly speaking, is a female under one year old. After she had attained her full maturity she is a hen, but in the trade we speak of a fowl as a pullet until she has completed her first year's laying. Therefore it is correct to speak of her as a pullet until she is eighteen months old or has begun her first moult. A cockerel is a male bird under one year old, but he is usually spoken of as a cockerel until he has at least entered well upon his first year as a breeding cockerel. Cocks are older males, usually having passed through one season's breeding. If you order cockerels for breeding purposes you will get birds that have not been used for breeding. When ordering pullets you will get females that are under 18 months at the most. A cockerel should never be used to breed from before he is a year old. A pullet, if she begins to lay at six months, may be bred from at nine months of age, but she will be better if not bred from till she is one year old. The progeny from mature stock is much more vigorous and of larger size than that from immature stock.

There are still many people asking about capons, imagining them to be something different from common chickens. Capons are male chickens which have been caponized or desexed in order to enable them to attain larger size. A capon produces a better class of meat than a cock, is docile, easily fattened, and usually ready for market at the age of one year or 18 months, depending on the time of year and the prevailing prices. Many poultrymen caponize all surplus cockerels, especially the late summer ones. They bring 20 cents and upwards per pound at a time when old cocks bring from three to five cents per pound.

COOPS AND EQUIPMENT.

A collection of the different kinds of chicken coops which one sees in a trip through the country would show a wonderful variety, writes Grant Davis in Poultry News. From the barrel with stakes driven in front to confine the hen to the well-made brooder pen which can be purchased from the poultry supply houses, there are all grades and kinds. Perhaps the most common form is the A-shaped coop with slats nailed across the front to keep the hen in and allow the chicks to pass out. When you want to shut it you set a board against it and prop it up with a stick, and when you want to let the hen out you tip up the front and balance it on a prop. You never know how many chicks you are going to kill when you let it down.

About as good a coop as I have used I have made out of store boxes, and they require little work to make and are cheap. I take a good tight box costing ten to fifteen cents and about 20x30x14 inches, or it may be a little larger or a little smaller. Take one side of the box off, nail cleats on it and make a floor of it. Make the dimensions of this floor such that the finished coop will set over the floor and not on it, thus preventing rain from running in on the floor. The top of the box which is, we will say 14x30 inches, becomes the front of the coop. One-half of this is boarded up and in the opening a screen door is made to slide back and forth, opening or shutting the coop. This door may be covered with one-inch chicken wire netting. If it is desired to shut the coop tightly, a board door is fastened on the outside with hinges so as to be opened and closed easily. This door is not necessary only for early chickens. The sliding screen door will be found a great convenience. It may be opened a small space to allow the chicks to pass out while confining the hen, and it is easily closed at night to keep out all nocturnal enemies. The movable floor is an advantage as it can be readily taken out and cleaned. This should be done occasionally and some dry earth or sand sprinkled on it. The coop will then be always dry and clean and is much better than a ground floor which will be damp in wet weather and breeds disease and gapes.

The coop should be painted to make it last and over the top is nailed a strip of rubberoid or other roofing material to shed all rain. You then have a coop which is hard to improve upon and with a little care it will last for a number of years.

I make considerable use of a larger coop four or five feet square with sloping roof. It is made two and one-half feet high on rear and three and one-half in front. It is made of one-half inch pine boards covered with roofing paper and with a sliding screen door. About forty young chicks may be put in one of these coops with one or two hens, and when the chicks are half grown, roosting poles are placed within and the pullets allowed to remain until it is time to remove to winter quarters. When using hens for hatching, these coops are just the thing to set them in. They will hold three each, and supplied with food and drink, the hatchers will usually set their time out in an orderly way and be free from molestation.

These are the days when strictly fresh eggs are at a premium and care should be exercised by the farmer to market none but strictly fresh eggs. The eggs should be gathered frequently during the day, for if left in the nests, even for one day during very hot weather, they commence to spoil. When a nest full of eggs is found in the hay mow they should be carefully candled before being sent to market or they may be found to be in the same condition as eggs purchased by Paddy Doolan. Paddy went one day to the store to buy eggs. "What are eggs today?" he asked. "Eggs are eggs today, Paddy," replied the storekeeper, looking triumphantly at two or three lady customers who happened to be in the store. "Faith, an' I'm glad to hear you say so," said Paddy, "for the last ones I got here were chickens."—Kansas Farmer.

A reader inquires: "Is charcoal a good thing for fowls, and how do you feed it? Which are the best layers, White Leghorns or White Wyandottes?" Charcoal is the best cleansing medicine for fowls and is a preventive of disease. Ashes from wood fires may be thrown into the poultry yards and the chickens will pick out the charcoal, or a few ears of corn can be put in the oven and charred and then fed to them. The Leghorn family have the reputation of being the best layers of any breed and probably head the list as spring and summer layers, but take it all the year around, winter and summer, the Wyandottes will not be far behind them in egg production and being larger and plumper are much better table fowls.

Don't try to see how small an amount of grain or feed you can winter the poultry on; feed generously, and note the returns. Often just a small increase in the amount of feed will mean several dozen more eggs, and these extra eggs will perhaps balance the scale on the right side for your poultry keeping.

In building a new hen house, hang the roosts from the roof with heavy wires, with a dropping board 6 inches below. If the wires are fastened in hooks at each end of roosts and at each corner of dropping board they can easily be taken out for cleaning.

Feed well the old hens that you intend to sell when they are through laying. Watch the market and sell them just before the rush sale of poultry begins in the fall. Get all the eggs you can from them this summer, but sell them while the price is still good.

Queries

Questions to be answered in this department should be received at this office no week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

ed Spider on Beans.

A subscriber sent to this office bean eaves that had been attacked by insects, some showing almost a skeleton f the leaf. These were referred to rof. H. J. Quayle of the Pathological aboratory and he reports that the rouble was doubtless caused by red pider. He adds: "This trouble is not sually severe enough to demand reatment. Treatment for this pest s ordinarily application of sulphur vith lime, one-fourth lime and three-ourths best grade of sulphur; or sul-hur, 30 pounds; lime made into milk f lime, 15 pounds; water 200 gallons. Or use commercial lime-sulphur, 4 to 5 gallons with 200 gallons of water.

Alligator Pears.

What climate and soil are most suitable for alligator pears? What is bearing age? At what season should they be planted?—K. M., Fresno.

Climate suited to the orange is approximately right for the avocado or alligator pear, though two points have yet to be proven out, that is, degree of cold it will stand and degree of heat. It will hardly stand as low temperature as the orange, and the amount of heat is still a question. We know of no profitable trees in the hotter interior valleys, but they are being given a test which will require a few years to prove out. Soil conditions preferred are sandy loam with sufficient drainage to permit of a warm soil.

Bloody Milk.

I have a two-year-old heifer that dropped her first calf two months ago. Some two or three weeks ago she began giving bloody milk from one quarter and keeps it up. There are many big clots in it and it is all bloody. The milk is not ropy, and there is no cake. Milking does not seem to pain her in the least. She seems well in every way and has a good appetite. I have been bathing with hot water and rubbing with camphor and lard twice a day. Any advice you can give me will be greatly appreciated.

Should I milk her three times daily or will the extra irritation thus caused do more harm than good?—W. P. R., Claremont.

While a bruise on the udder may cause bloody milk, I am inclined to think that in heifers the cause is pressure within the cells. Unless the milk flow is great enough to distress her, twice a day milking is sufficient. There is almost nothing to do in these cases but let time work it out. The camphor tends to dry up the milk flow and should be used carefully on the portion of the udder alone that is affected. The clots that come usually indicate that the healing process is commencing. The camphor is fully as good without the lard, but if much rubbing is done the lard prevents chafing. I have had a number of cases like this in heifers and they cure themselves before the next calf comes.—M. E. S.

Pruning Peaches.

What is the best time to prune peach and apricot trees? Have been told to prune heavily after bearing. They are young trees and have borne heavily.—Subscriber, Santa Ana.

The ordinary time for pruning of deciduous trees is in the winter, when they are dormant. There is an established saying: "Winter pruning for wood and summer pruning for fruit." With the peach you must be careful, however, in doing very heavy summer pruning. Summer pruning with the apricot is more common. It is now too late to do that. The proper time is in July or immediately after the removal of the fruit. Severe cutting is made, heavy irrigation is given, when a strong growth of new wood is induced, which gives abundance of fruit buds for the coming year, but heavy summer pruning at this time would only result in cutting off many of the

Land To Rent

in artesian belt of Kern County, N. W. of Wasco, either for cash or share of crop with option to purchase if desired at $100.00 per acre. The land is good for alfalfa, cotton, grain, etc. 204 sacks of onions weighing 100 to 105 lbs. to the sack raised on ½ acre.

WATER

is artesian, cheap, pure and unlimited in quantity.

All conditions favorable for making money.

Preference of employment given to renters on Company's Improvement Work. Wanted men to rent at once who have stock and tools for road and ditch work.

This week we begin operations upon the ground by opening a ranch headquarters on Sec. 17. Stock, implements and grading tools have been provided to operate the company's experimental farm and to give immediate employment to renters on ditch work. Some of the best paying crops should be planted in October. Write us and make arrangements to visit the land at once.

Plants of all kinds, wholesale and retail, at Las Palmas Greenhouses, Palo Alto, Cal. Contracts solicited. Let us know your needs at once.

FARM LANDS FOR SALE.

For Sale—

OWENS RIVER VALLEY

RED APPLE LAND.

Los Angeles' new water supply from the Owens River Valley opens up the most fertile land in all of Southern California. This land is wonderful in its productiveness, beyond belief. Potatoes that run as high as 500 bushels to the acre, with an average of 330; alfalfa, 3 tons to the cutting; timothy, with 10-inch heads; corn, 70 bushels to the acre, and famous for hogs; the world's prize at the Portland Exposition for honey; the finest apples grown on the Pacific Coast, Spitzenbergs and Winesaps, the famous varieties; no better poultry country in California.

No other land in California can compare with it; foothill land with gentle slope, giving perfect drainage; one of the most complete gravity concrete water systems in the State now being installed by men whose irrigating systems in the orange belt of Southern California stand as models for model orchard irrigating. Water from the hundreds of lakes and the high Sierras, giving an inexhaustible and assured supply. The Southern Pacific's new main line to the East now runs through the valley. The choicest apple land will be subdivided into ten, twenty and forty-acre tracts.

The elevation is 4000 feet. Typical California summers, with no intense heat, and with the thermometer at 10 deg. above at the coldest. Practically no rain—about four to five inches during the entire year; 300 days of sunshine, absolutely no fog; has the finest scenery in America; the high Sierras at your very door; trout streams within walking distance. You can leave the valley in the morning, go to the summit of the Sierras, 14,000 feet elevation, camp at one of the beautiful mountain lakes and return to your home the same evening.

This land is not for speculators, but for real serious farmers, who know the value of good land and water when they see them. Will send pamphlet and pictures upon application.

The JAMES R. H. WAGNER CO.,
Room 10,
329 So. Hill St.,
Los Angeles, Cal.

Please mail, without expense to me, your printed matter on Owens River Valley lands.

MISCELLANEOUS

Nursery Business For Sale—Together with 11 acres set out to all kinds trees, fruits and vines, date palms. Owner of this has conducted nursery business in this locality for the last 7 years. It's the only nursery tributary to 100,000 acres of the world's best irrigated garden country, with unlimited possibilities. He would either retire from nursery business entirely, or would, if required, stay a year or so with the buyer until acquainted. The amount which will buy everything is $5000. This would barely cover the cost of raising of the trees and vines, besides over $10,000 worth of nursery stock which will sell readily next season. Do not miss this opportunity. Inquire at the Cultivator office for further information.

Free—"Investing for Profit" Magazine. Send me your name and I will mail you this magazine absolutely free. Before you invest a dollar anywhere, get this magazine—it is worth $10 a copy to any man who intends to invest $5 or more per month. PRUNING PEACHES.

(Continued from Page 231.)

fruit buds for next year's bearing, and not give time for formation of new ones. Now, we would wait until winter and give the regular tree shaping pruning, removing cross limbs and topping according to former growth of the tree.

Time for Cutting Eucalyptus.

We wish to use eucalyptus for fuel. Please tell us the best time for cutting so they will sprout and keep on growing.—M. E. F., Goshen.

This is a question which we wish would bring out a number of answers from those who have had experience. Personally, we have cut trees any time after Thanksgiving and before the first of January and have never known them to die. They seemed to be dormant, then after the rains and the warmer weather of spring they have invariably sprouted. We have known others—only two, however, cut in spring when sap was flowing strongly, to die. We have not observed this question to an extent sufficient to justify the claim that a rule has been established.

Pendulous Crop.

I have a young turkey that has a very large crop; it hangs down and seems to bother it when running. Otherwise seems to be in perfect health. What is the cause of this and what is the best remedy?—Subscriber, Orland.

Your turkey has what is called pendulous crop. This defect comes from it having been fed a wet mash, and too much of it, which has weakened the crop. It may possibly recover if cautiously fed with charcoal mixed in it, but the only sure way is to cut a small piece of skin the shape of a fish out of the outside skin that hangs down and sew up the cut with about two stitches of white sewing silk, tying off each stitch. Give only a little food easily digested. If you leave it without treatment the food may hang in the crop until it ferments and then it poisons the turkey.—Mrs. A. B.

Roup.

About three months ago I noticed my young turkeys' eyes being closed in the morning. When I opened them a white froth would come out. There was a discharge from the nose and eyes swelled and shut. The lower part of the mouth gets a dirty crust in it and some of them have yellow spots in their throats and mouths. They cough or sneeze nearly all the time, eat until they can't see, always seem hungry.—Mrs. C., Orange.

Your turkeys and your chickens also have roup. I would advise you to cure them as quickly as possible, and then sell them for the market and do not keep any of them for breeding next year. Disinfect the premises as thoroughly as possible either by spraying the houses and yards or by growing a crop if they are at large. Roup is very infectious and it is very difficult to keep the fowls free of it if once it gets in.

One of the best cures is as follows: One tablespoon of castor oil, half a tablespoon of turpentine, half a tablespoon of camphorated oil, one tablespoon of kerosene, a teaspoon of eucalyptus oil, and four drops of carbolic acid. Shake before using. Squirt a drop up each nostril and into the cleft of the mouth. This is an excellent cure and cheap. A small sewing machine oil can is very handy to use in administering this.

Mix Germozone in water according to directions and dip the head in. Holding it under whilst you count three slowly. Wipe off the head and especially the nostrils and burn the rag. If you cannot get Germozone, buy ten cents worth of permanganate of potash and put a little into water until the water is pink. Then add a small bit of bluestone as big as a pea to a quart of water and dip the head in that. There are other prepared remedies that are excellent. All these contain the permanganate of potash and bluestone properly mixed, and can be easily and quickly used. Get rid of the lice, for if the turkeys and fowls have roup they are sure to have lice.—Mrs. A. B.

Self Milkers.

Referring to a question recently asked in the Cultivator, one which often comes to this office, Mr. J. C. Thompson of Imperial writes:

If "Subscriber," Visalia, will take an old, small, but thick horse collar and place it top down and face in front (upside down and wrong side out) on his self milking cow she will discontinue that bad habit.

Household Department

JUST RUMOR.

Sing ho! for the thrill of the shimmering dawn
When the heart of the morn is a-quiver;
When the hilltops are kissed by the reddening mist
That slowly creeps up from the river,
The blood's newly stirred by the song of the bird,
Though scoffers may scorn and deride it.
To rise with the sun is most glorious fun,
I have heard—but I never have tried it.

Sing hey! for the joy of hard, health-giving toil;
Of setting the pace for your neighbor,
Of tending a cow till your sweat-beaded brow
Is set with the diamonds of labor,
Of hustling in hay through the hot summer day;
When once you have fairly begun it,
A working career fills the heart with high cheer,
I have heard—though I never have done it.

Sing hi! for the sternly abstemious life,
When one has the courage to risk it.
There is never a food that is nearly as good
As water and steel-wire biscuit.
No wise man would eat either pie, cake, or meat;
They injure one's conscience and credit,
So I've read—though I never have led it.

—New York American.

UNINTENTIONAL TEST.

I have accepted! Fifteen hundred a year. Isn't that fine?

Henderson spoke with a radiantly happy accent; but the girl only turned her face away quickly from the young clergyman and looked across the fields toward the tree-buried village. To be sure she was glad that Dwight had been offered a remunerative field. But two thousand miles is far to go; and going away is often easier for the one that goes than for her who stays.

"We shall miss you—your mother especially," she conceded, nervously playing with the leaves of a plant. "Yes;" it is fine. I am glad for you."

"Come down for a walk in the orchard," he begged, brightly. "I want to tell you about it."

"I thought you had told me about it," she observed with quiet mischief, though her pulses quickened.

"Oh, I want to—to tell it over again from another point of view."

This time the color came into his own face. She knew—or rather she had hoped—that he was waiting only for the prospect of a living salary before telling her of something which she was willing to hear after due resistance.

She looked at him with a glow in her cheeks. She liked to hear him speak so.

"Mother's long sickness has kept me in debt somewhat," he ruminated, with a sigh; "but now I will be able to get ahead. There is a fine house waiting in the new parish, Marion. When I have it all ready and a little money saved up then you will—"

The quiet cool of darkness was settling. Dwight paused to watch a humming bird dart in and out of the porch before he finished the sentence with a softly queried "Won't you?" He could just see her head bow in promise. A silence ensued, and before it had grown much darker he said his good night and departed.

The night was early yet. Dwight had left her unconventionally soon for his mother's sake. Marion found her father in sociable converse with an old friend he had unexpectedly brought home for the night, a grey-haired guest who had spent his boyhood in Eastwood and was stopping over now to freshen old friendships. Marion liked him very much.

"I've enjoyed being in the old town again," he told Marion, when a little later her father had gone to hunt up some papers. "I never want to forget it and I never want to be forgotten in it. We have been talking of that and your father tells me—" he switched off suddenly, a keen look on his fine face—"that you love your church very much."

Marion blushed unguardedly; that word was very fresh in her thoughts.

"You have a fine young minister in your church," Mr. Courtland persisted, his slim, wavering fingers passing thoughtfully over his soft white hair. Marion dropped her glance as the old man continued: "He hasn't enough to live on and maybe—maybe there's a girl waiting somewhere patiently. Now shall I tell you how I am going to make myself remembered?"

Tomorrow your father is going to draw up papers for an endowment of twenty-five thousand dollars, the interest to go toward the minister's salary."

Marion's face showed her frank gladness. "Oh, that will be glorious for the little church," she exclaimed, delightedly. "But you are too generous—"

"Tut! tut!" he interrupted. "It's nothing. I could do much more; but it wouldn't be good for the church. Now—now wouldn't you like—nobody knows this yet but your father and myself and you—wouldn't you like to be the one to tell the minister?"

His manner showed an eager, especial interest. Marion knew her father had been speaking of Dwight Henderson and herself in the same breath. This dear old bachelor friend with the fabulous wealth understood exactly. He was match-making in his own delightful way.

Lying wakeful that night she pondered with regret the circumstances which had led to the unfortunate situation. The thought of leaving her home and her father grew more and more intolerable now that it seemed so unnecessary.

But Dwight had made up his mind and committed himself. In the woods, when she had playfully asked whether he would recall his acceptance at her bidding, he told her gravely that it was too late, that even if the parish raised his salary he could not now withdraw his promise. And she had agreed with him.

With a sigh she told herself that she must not let Dwight know she had so much as thought of looking back. But the regret was still with her when she awoke in the morning.

Dwight was coming this evening to tell her father. Meantime she went out early for a call on Mrs. Henderson. The two were close friends from days far back, therefore made the most of their morning. Mrs. Henderson knew somewhat of the mill town to which Dwight was going.

"It won't be such a dear environment as we have here, my girl," she sighed, wistfully. "But," she continued, more cheerfully, "it will have its compensations and I know you will make the most of the opportunities it affords."

The letter, written when she reached home, was dispatched to Dwight by her father's hand, after lunch.

"I know you are too strong to spend time in vain regrets over this missed opportunity," was all the comment she allowed herself. "I shall be expecting you this evening."

"And when he comes," she told herself, softly, "he will scatter my disappointment to the four winds." There was a note of pride in her voice.

She had not expected to hear further of him until he called, in accordance with his habit, about dusk. But two or three hours later a boy brought a note. It was hastily scrawled and only a word or two:

"Am going to decline the call by telegraph. Do not think hardly of me and be sure I will come tonight."

The dusk came at last and with it Dwight, depressed, but not too much so to notice her own dejection.

"You are disappointed—very much disappointed?" he instantly remarked, with a slow, desponding interrogation.

"Oh, Dwight, I am," she admitted frankly, at the same time turning

away her eyes, which were fast filling with the weight of her disappointment.

"Come out into the orchard while I tell you about it," he begged, in what seemed to her a hatefully humble tone.

But she declined with a slow shake of her head. Nor would she look at him. During five minutes of silence she did not know what he was doing, though she heard him sigh once.

"Marion!" he said, finally; and there was a note in his voice that brought her about face in spite of herself, to meet the direct glance of his brown eyes.

"Are you so disappointed that you turn against me?" He asked it gently, but in a tone that required an answer.

"I—I ask too much, I suppose," she faltered; "but if you have declined that call I feel that I must—that I want to think over the promise I gave you last night."

He looked at her with whitening face and set teeth.

"I have declined it," he admitted, slowly and quietly, "beyond all chance of reconsidering. You—you are as free as you please."

He had risen wearily as if to go. There was a step on the stair just then and Marion recognized her father's coming. She was not sure whether she was glad or sorry for the interruption.

"Hello, Dwight!" Mr. Howell greeted, jovially. "You're a good fellow. And say," he begged, as he came closer and put a hand confidently on Dwight's arm, "try not to have any hard feelings against me. I was so busy with a friend this afternoon that I forgot all about your letter."

A wave of relief came over Marion's face. She had thought her father perhaps a trifle overstrung. But she did not immediately recognize the letter in question as the one she had sent Dwight that noon.

"From you, Marion," Dwight commented, interestedly, as he paused for permission to open it.

"Oh, no, no," Marion hastily intervened. She had suddenly comprehended that the letter could have had nothing to do with Dwight's disappointing action. "Don't open it yet, Dwight. But tell me—I don't understand—tell me first why you declined the call?"

Her tone was perplexed and questioning. Dwight, wonderingly, came closer.

"I was driving across country this morning with Doctor Bolton," he began, venturing to take her hand, "and I told him for the first time of the call. But"—the gloom in Henderson's face deepened—"he told me that under no circumstances—under no circumstances, Marion—must I take mother to that climate. And he convinced me of it. I couldn't leave mother behind, could I, Marion?"

"Of course not," she admitted, the color in her cheeks heightening as she held out her hand. "Forgive me, Dwight," she asked, softly.

He took her other hand and drew her close, with a gesture of the night before.

"It was mighty hard to give up the chance, Marion," he confessed, a world of regret in his voice; "mighty hard to think of a long wait before you and I—"

"Come out into the orchard, Dwight," she invited, temptingly. "Bring the letter. We'll read it together."—Journal of Agriculture.

FURNITURE POLISH.

Alcohol	1 pint
Turpentine	1 pint
Boiled Linseed Oil	1 pint
Japan Dryer	1 pint

Shake well before using.

Another.

Linseed Oil	1 pint
Strong Vinegar	5 ounces
Spirits Turpentine	2½ ounces
Hydrochloric Acid	½ ounce

Sometimes a little chloride of antimony, (butter of antimony,) say ¼ ounce, is added to the mixture.

PERMANENT SOAP BUBBLES.

Castile Soap	¾ oz.
Cold Distilled Water	1 pt.

Shave the soap very fine, and allow the water to stand upon it for a day. Pour off the supernatant solution, and mix it in the proportion of two ounces to one of glycerine. Blowing a soap-bubble is a capital "dodge" for keeping children still.

Hay.

Scott, Magner & Miller say:

Arrivals of hay for the six days ending today have been 5500 tons, being a slight increase over last week. It has been surprising that these stupendous amounts of hay have been taken care of so readily. While naturally these heavy accumulations have been difficult to handle, yet they have been quietly absorbed and placed in such a way that the market has remained steady and unchanged. It was usual heretofore under such immense arrivals to see a dull and soft market and a disorganized condition prevail.

The exceedingly heavy arrivals during the last two weeks have been accounted for by the fact that the hay remaining in the fields is being rapidly shipped on purchase account as the farmers are anxious to get the fields cleared up as early as possible, after they have sold their hay. It is not expected that arrivals by the railroads will be as heavy from now on, and that conditions will adjust themselves to a better basis all along the line.

The market on alfalfa can be quoted as unchanged. There has been considerable coming in steadily, and this hay has been going out to fill orders that have been taken to fill up dairy barns for winter use. The yield of alfalfa from the river districts is turning out heavier than was anticipated earlier in the season. There is considerable alfalfa now offering for sale in various sections.

We quote the wholesale prices in round lots on today's market as follows, viz:

Fancy wheat hay	17.00@18.00
No. 1 wheat or wheat & oats	15.50@16.50
No. 2 wheat or wheat & oat	12.00@13.00
Choice tame	14.50@15.50

Citrus Fruit Market

LOS ANGELES, Sept. 13, 1911.

There are probably less than 1000 cars of Valencias yet to go. The earlier estimates are being materially reduced by the small sized fruit. The heavy crop has prevented sizing up and this has thrown into auction markets full cars of small offs, which accounts for many of the low quotations given. Owing to a shortage of local fruits in many Eastern markets oranges have commanded fair returns and with regular sizes some excellent prices have been received.

Foreign lemons are still in light receipt and a material increase in demand for Californias is noted. Prices are good.

Shipments.

Shipments of oranges to date since November 1, 1910, 35,792 cars, lemons 6,271, total 42,063. To same date last season: Oranges 24,603, lemons 4,490, total 29,093.

NEW YORK, Sept. 12.—Nine cars Valencias and one car of lemons sold. Market easier on Valencias, lower on lemons. Fair.

TWENTY MILLION LAKES.

A writer in Missouri is urging the necessity of irrigation and uses the present season of drouth over the entire East to give emphasis to the need in all the humid part of this country for preparation for irrigation. He uses as his slogan, "Twenty Million Lakes for Three Hundred Million People." He would conserve water in ponds and reservoirs during flood time so that it may be used in periods of just such drouth as has made the East suffer this year. The building of this immense number of reservoirs is decidedly fanciful, but there is a lesson in it. Irrigation is marching on apace even in the humid East.

One of the news notes from Southern California of the issue of Aug. 24 located the Irvine Ranch in Los Angeles County. This was purest oversight, as this great ranch is well known to be in the southern part of Orange County. The item referred to contract being let for a sugar factory on the Irvine Ranch which will increase to five the number in rich little Orange County.

UNFURL YOURS.

It ain't all pickles, and it ain't all pie,
And it ain't all honey in this good old world—
But the joys will double and will multiply
For the man with the banner of a smile unfurled.
—Green Bay (Wis.) Gazette.

"The boy may be human, but his soul comes from God; handle him studiously, and take care that you never forget that you are dealing with one who may tomorrow, along with a bunch of other boys, make up a bigger and better class of men than exists today."

Ideals are like stars; you will not succeed in touching them with your hands, but, like the seafaring man on the desert of waters, you choose them as your guides, and, following them, you reach your destiny.—Carl Schurz.

Do your cows milk hard? Send 50 cents for teat expander. O. J. Weber Co., 225-227-229-231 East Sixth St., Los Angeles, Cal.

CALIFORNIA WILD FLOWERS.

(Continued from Page 225.)

immense size. This and the former species are the most desirable when large specimen trees are desired.

Quercus Engelmanni is to be found in many localities. It is a medium sized spreading tree with light-colored, rather smooth bark. The leaves are variable in shape, sometimes entire and sometimes with deep coarse teeth.

The Scrub Oak (Quercus dumosa) is common in the chaparral belt of our mountains. It is very variable in character and specimens are to be seen in the same location with many variations both in shape and size of the leaves and also the acorns.

A species found plentifully in Chatsworth Park and San Fernando is the Quercus lobata (Valley Oak or California White Oak) as it is sometimes called. This is a deciduous species. It forms a large, stately tree. The leaves are pale green and deeply lobed, very much like those of the English Oak. Many people have the idea that our oaks are so slow growing that it is not worth while to cultivate them. This is a mistake, for when grown under favorable conditions a Live Oak will grow as fast as many of the exotic trees which we now plant in our gardens. I have known trees which were three feet high in one year from the time when the acorns were planted, and seven feet high at the end of the second year. The most important thing in growing oaks is to give plenty of water and never let them get dry, as this checks the growth.

The California Laurel or Bay (Umbellularia Californica) is a handsome tree with shining dark green lanceolate leaves. This tree is easily propagated from seed, and could be used to advantage either for single specimens or as a street tree.

There are few trees in cultivation which for beauty surpass the Catalina Cherry (Prunus integrifolia). This tree is to be found in Cherry Valley and in many precipitous canyons on the Island of Catalina. While exploring a canyon on the island a few years ago I found large numbers of these trees growing among the rocks in places which were almost inaccessible. The leaves are large, oval, and of a rich glossy green. The fruit is dark red, has a rich flavor, but is nearly all pit, so is practically useless. This tree has been cultivated to some extent, but not generally. In its native habitat it varies considerably in shape, but under cultivation, if well watered and properly pruned when young, it makes a tree of perfect shape and is an ideal tree for street planting.

The Arbutus Menziesii (Madrone) is a handsome tree with pretty foliage and deep red bark, and is well worthy of a place in our gardens.

In Coniferous trees, the Monterey Pine (Pinus radiata or P. insignis as known to nurserymen) and the Monterey Cypress (Cupressus macrocarpa) are both so extensively grown and so familiar to everyone that they need no further mention here.

The Torrey Pine (Pinus Torreyana), which grows on the bluffs at Del Mar, in San Diego County, is a rather small tree, with spreading branches and dark brownish bark; the needles are long and five in a cluster. This tree succeeds well under cultivation, and forms a handsome tree.

A pine to be found in Antelope Valley and from there northwards is the Digger or Silver Pine (Pinus Sabiniana). It is not a large tree; the needles are light green or glaucous, three in a cluster and drooping. It succeeds well under cultivation, and forms a handsome tree.

Another pine which must not be forgotten, as it is one of the finest of our native trees, is Pinus Coulteri (Coulter's or Big Cone Pine), as it is often called, having the largest cone of all trees. It is a medium sized tree with thick, rough bark; the needles are in clusters of three, stiff and erect and of a dark blue-green color. It grows in the San Jacinto and San Bernardino Mountains, at an elevation of from 4,500 to 7,000 feet, but, unlike most of our native pines from high altitudes, it succeeds well when cultivated in our valleys, and a few fine specimens are to be seen in Pasadena and other places. There are a great many of our pines which are magnificent trees in their native habitats in the mountains, but which will not succeed when transported to the valleys and lowlands. The three species mentioned here are probably the most desirable native pines for cultivation. The Monterey Pine, which is so largely grown on account of its rapid growth, is really the least desirable, as it is a short lived tree. The other species mentioned, though slower growing, are long lived trees, and for beauty far surpass the Monterey.

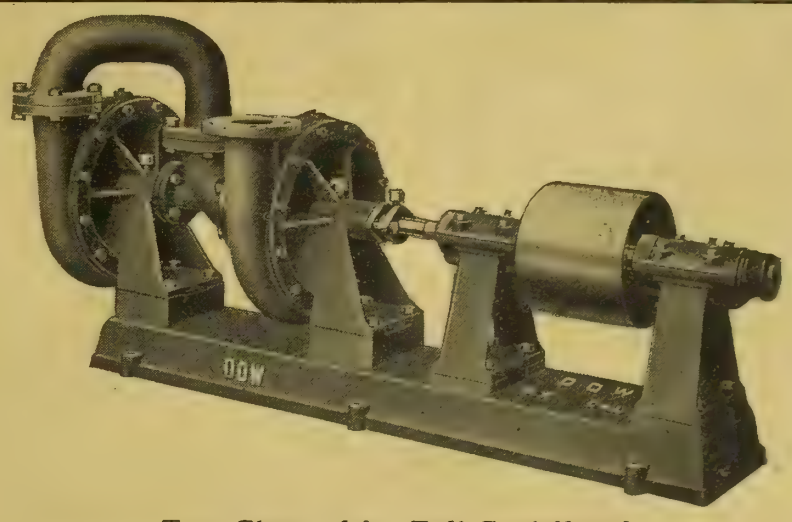
A most beautiful tree found in our mountains is the Libocedrus decurrens (Incense Cedar). It is not a very large tree as a rule, but occasionally immense trees are to be found. It has bright cinnamon-red bark and pale green foliage. This tree succeeds well under cultivation.

All the trees thus far mentioned in this paper, with the exception of one oak, are evergreen. Here in California the idea seems to prevail that all our cultivated trees must be evergreen, and we lose sight of many beautiful trees because they are deciduous. While evergreen trees are desirable in a general way, if we have nothing else, and we see them continually year after year, they become very monotonous. We miss the soft, delicate greens of the deciduous trees which are so restful to the eyes during the hot summer days and are such a contrast to the heavy, somber colors of the evergreens. We also miss the autumn tints, the beautiful browns and yellows and reds which tell us of the fall of the year. There are, no doubt, many deciduous trees that could be used to great advantage in certain situations.

The Sycamore (Platanus racemosa) is familiar to everyone. With its old, gnarled roots and grotesque forms, it is the most picturesque tree of a California landscape. To appreciate this tree one should visit the Sycamore Grove Park, between Los Angeles and Pasadena, where a park has been laid out under the shade of these fine old trees planted there by nature herself. The Sycamore does well under cultivation and grows rapidly.

Another beautiful deciduous tree found in the canyons of our mountains, at an elevation of 3,000 to 6,000 feet, is the California Maple (Acer macrophyllum). It grows into a tall tree; has rough furrowed bark and large leaves.

The wild walnut (Juglans Californica) is common in many of our foothills. It varies considerably in its nature, sometimes being but a mere shrub, and in other localities forming a large, spreading tree. The Cottonwood (Populus trichocarpa), the Alder (Alnus rhombifolia) and a great many other deciduous trees are worthy of cultivation, but time will not permit of their mention here.



Two Stage, 4-in. Belt Centrifugal

High Grade Pumps at the Price Usually Paid for Common Pumps

There is no excuse for delaying the installation of that pumping plant on the score of not being able to afford it.

It matters not what your irrigation problem is; a

DOW PUMP

can be had that will meet your conditions. It will be "all pump," with high efficiency and long life, made from the best material obtainable, and erected by capable workmen.

If you have ever thought about irrigation, it will be time well spent to talk with us. We can give you the benefit of thirty-seven years' experience, and probably save you money.

If you have never thought of irrigation write for a copy of

AGRICULTURAL PUMPS

anyway. It is free and may contain information that will be profitable to you.

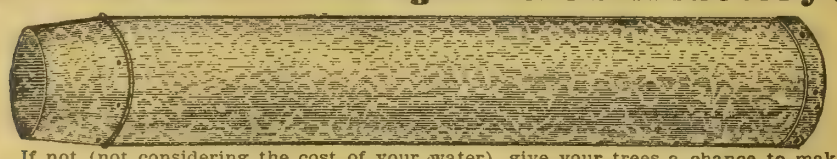
Pioneer ROOFING

Time to Make Repairs

Are your roofs in condition to withstand the winter rains? Pioneer Roofing is positively unexcelled for repairing *or replacing* old and leaky roofs. Easy to lay. No special tools needed—no experience. Comes in handy rolls of 108 square feet. If your dealer doesn't handle Pioneer Roofing, send us his name and we will see that you are supplied. Write for booklet and samples. Both are free.

PIONEER PAPER COMPANY
247-251 S. Los Angeles St., Los Angeles, Cal.

Is Your Mode of Irrigation Satisfactory?



If not (not considering the cost of your water), give your trees a chance to make good by giving your orchard the proper amount of water all over same, and not three-quarters of your water supply within forty feet of your head flume.

The surface irrigating pipe we manufacture will remove this obstacle—will cut your water bill—is more convenient to use and will last a life time.

Write us, stating your requirements and we will cheerfully furnish you with prices and information desired.

We also manufacture Ells, Tees and Gates for this special pipe and are in a position to manufacture any special fittings you may require.

THE AMES IRVIN COMPANY Corner Eighth and Irwin Streets, San Francisco, California

Save Money By Buying This Good Second-Hand Pipe

We can supply you with any size and quantity of Standard Pipe or Casing—all new threads and couplings—all stock guaranteed first-class.

If thinking of buying any kind of pipe, your best interests will be served by writing us for prices and particulars.

PACIFIC PIPE CO., Main and Howard Streets, SAN FRANCISCO.

Give the Pomona Patent Pressure Gate a Trial

No rubber or wooden facing to rot or wear out. Absolutely water tight when closed. Locking mechanism is protected against rust or clogging with sand or dirt. Simple in construction. Cheap in price and as durable as solid iron.

THE LOCKING DEVICE is the simplest made, merely a tapering screw with split tapering nut socket. It locks the cover in any desired position or locks the faces, making an ABSOLUTELY WATER TIGHT JOINT.

TWO FOOT HANDLE FURNISHED WITH EVERY PRESSURE GATE FREE.

ALSO A FULL LINE OF CIRCULAR VALVES FOR ORCHARD AND ALFALFA IRRIGATION CARRIED IN STOCK.

Fertilize With Air

Nodules on Vetch Roots

The nodules on these roots are colonies of bacteria that suck the nitrogen from the air and store it in the plant, which then becomes a valuable fertilizer. The bacteria were placed there by inoculating the seed with

FARMOGERM

(High Bred Nitrogen Gathering Bacteria)

Science has thus brought the wonderful possibilities of bacteria fertilization to a thoroughly practical and simple method of application.

This places within reach of every grower an enormous increase in the tonnage and fertilizing value of

COVER CROPS

Vetch, clover, fenugreek and all legumes can be inoculated with Farmogerm at a nominal expense and by a simple operation, or we will treat the seed for our customers if preferred.

California Cultivator

Vol. XXXVII. No. 12. LOS ANGELES: THURSDAY, SEPTEMBER 21, 1911 One Dollar the Year

Welcoming the Swiss Milch Goat to California

Written Especially for the Cultivator by Winthrop Howland, Redlands, Member Board of Directors American Milch Goat Record Association

Some ten years ago while at San Blazien, a small mountain village in the German Schwartzwald, near the Swiss border, my attention was attracted by some very handsome and unusual appearing milch goats of Swiss strain. Much more like deer in appearance were these goats than any I had ever seen before, and their great size and high-bred bearing made upon me a lasting impression.

Here in this out-of-the-way hamlet, for the first time I saw milch goats that would draw the attention of any enthusiast of fine dairy stock, and nowhere in the United States (my native land) had I ever seen or heard of such superior animals.

When about 1905 I came to settle in California, it occurred to me that in this climate where conditions are such that dairying is carried on successfully only when ample facilities for irrigation are at hand, why are not milch goats the proper creature for this section, instead of cows? Here was the situation: cows have no natural pasture in this semi-arid region during many months of the year, whereas were goats kept, the dry weeds and sparse grasses in the chaparral could be put to use and made of great economic value. But if my reasoning was sound, why were not milch goats generally bred hereabouts, and if one wished to establish a herd where might be obtained foundation stock of some superior strain?

The first question was answered by making a tour of inquiry in the neighborhood of Los Angeles, and it was rather surprising to learn how many "nannies," as they were called, were kept by individual families of moderate means as a source of milk supply. In many a backyard and on vacant lots I found nondescript does staked or in little corrals, and a few minutes conversation with the owners would prove how highly the milk of these does was valued, and how economically they were kept. Most of these goats were either part Angora, or so-called Cashmere, or from the wild bands of Catalina Island, where they had been caught as kids and brought to the mainland. My observations were convincing that there was a large demand for good milch goats, but where to obtain the valuable Swiss strains was another matter. After some interesting correspondence with the United States Bureau of Animal Industry and a careful study of their Bulletin on the milch goat, I determined to engage in the industry, and through the bureau was so fortunate as to locate a small herd of recently imported Swiss Toggenburgs owned by a gentleman near San Diego, California. These goats, an unusually fine thoroughbred registered buck, Prince Bismarck No. 159, and four thoroughbred registered does we secured, and these were the foundation of what is now the largest herd of thoroughbred Toggenburgs in the United States. We later secured other imported Toggenburgs from breeders in Illinois, Massachusetts and Northern California, adding some splendid stock to our herd, and from a Basque sheep breeder near Alhambra, California, we bought a number of hornless, part Spanish does, to cross with our imported Toggenburg stud, and at considerable trouble we more recently have had caught for us a band of wild Catalina does and shipped from the island to our ranch near Redlands. Some of the grade Toggenburg does, especially the second cross, show in a marked degree the fine qualities of the Swiss blood, and we are as rapidly as possible breeding up a most satisfactory type of grade.

Of the three breeds of Swiss goats at present in this country, Toggenburg, Saanen and Schwartzenburg, the Toggenburgs are the more numerous and by far the handsomest, as well as fully equalling or excelling the other breeds in milk production. The Toggenburg is to the goat family what the Jersey cow is to her kind,—the aristocrat of the race,—and not only are they remarkable as milkers but also they are most attractive and intelligent creatures, kindly and responsive in disposition and soon forming a strong attachment for those in whose care they may be. In Switzerland the Toggenburgs have been carefully bred for a hundred years or more, and the breed most intelligently

Toggenburg Does in Alfalfa Field at Rancho El Chivar. Note High-bred Deer-like Appearance of Does.

improved. In color they vary from light to a dark brown on the body, with white bars down each side of the face, and white from the knees and hocks down. Their coats also vary in length, some having short and others fairly long coats, but the hair in either case is thick and fine, and the race markings very distinct. Their heads are finely shaped and their long delicate and erect ears give them much the appearance of deer. Though a hornless breed, occasionally a kid is born with horns.

The milk of goats is far superior to that of cows, being richer in butterfat, the particles of which are much more minute than in cow's milk, and consequently more easily digested. For young children and invalids it is especially to be recommended, the more so as the goat is practically immune from the taint of tuberculosis. The following is a report by Dr. Barbellion of Paris at the International Congress of Medicine, on the digestibility of different kinds of milk:

"According to the reports which he has made it was ascertained that (1) The curd of cow's milk forms a dense adhering mass, which by agitation, separates into clots that are but slightly soluble. The curd of goat's milk, on the other hand, forms into very small light flakes which are soft, very pliable and very soluble, like those in human milk; (2) The curd in both human milk and that of the goat, after agitation, is precipitated very slowly and incompletely, while the curd of cow's milk is precipitated very rapidly and very completely; (3) Submitted to the action of digestive ferments, human milk and the milk of the goat were digested completely in twenty hours, while the same process applied to cow's milk showed only a very slight advance after sixty hours; (4) The milk of the goat approximates more in its composition and digestibility to human milk than that of any other animal."

Says Dr. Demade, director of the sanatorium at Haelbert, Belgium:

"Among the 300,000 goats of Belgium, there is probably not one afflicted with tuberculosis. Goat's milk being wholesome and beyond suspicion, there is no need to sterilize it. It may be taken raw, still palpitating with those mysterious forces which constitute life. D'Escherisch, who has studied comparatively fresh milk and sterilized milk, has shown that milk is not merely a nutritive liquid, but that it is clear that children that are delicate have need of the ferments contained in raw milk, and are quite incapable of digesting milk rendered inert by sterilization."

As the interest in goat keeping rapidly grows, I am frequently requested for information as to the yield of milk, method of feeding and general supervision of milch goats, and the following advice may be of assistance to those readers of the Cultivator who are beginners in the business.

Never breed a young doe under sixteen months of age, and eighteen or twenty months is better yet. Goats are such precocious creatures that they will sometimes breed as young as seven months, but by breeding too young the size and milk yield of the dam are permanently ruined, as does do not attain full growth until they are at least three years old.

The period of gestation is on the average 150 days, and usually after the first kidding twins are dropped.

Goats, like deer, have a rutting season, beginning in this climate in July or August, and lasting as a rule till March and sometimes, in rare instances, until later in the year.

In Southern California we consider September, October and November the best months in which to breed, as then the kids are dropped when the green feed is at its prime. Many breeders make the mistake of weaning kids too young. In order to insure size and vigor, kids should not be fully weaned until they are five months old, and then they need a little grain, oats or rolled barley, not more than one-half pint twice daily, and well cured alfalfa hay.

By far the best feed for stall fed goats is a small feed of grain morning and night, all the alfalfa hay they want, and such tree cuttings, weeds and fresh vegetables as may be obtainable from time to time, for a change of food is esesntial.

Oat hay may be fed occasionally, but not too often, as it is binding, and on account of the beards barley should never be fed, sore mouths resulting from its use. To avoid waste, hay should be placed in a feed rack having slats across the top. A lump of rock salt should always be where the goats may lick it at will, and clean, fresh water for them to drink. The most scrupulous cleanliness must be observed in all food given them, otherwise they will refuse to eat when hungry, and trampled hay they will not touch.

Contrary to popular opinion, goats are probably the most dainty of animals in their natural choice of clean food, and only when starved and ill used will they resort to such leavings as may be thrown to them.

Goats ranging free at pasture thrive splendidly on the natural growth of weeds and brush, and require little or no extra feeding except in cases of very old individuals or kids recently weaned, when it is best to grain moderately.

Every once in about six weeks it is necessary to trim the hoofs of stall fed goats, as, lacking the opportunity to range, their hoofs overgrow and turn under, and if neglected in time become deformed. It is a very simple matter to trim the outer hard edge of the overgrown hoof with a strong knife, and should never be too long neglected.

A common and distressing sight are the overgrown feet of many of the cows of this section which are never trimmed and grow to such length as to be unsightly deformities that must cause the poor creatures great discomfort. As a goat's foot is much easier to trim than that of a cow, there is no excuse whatever in permitting any overgrowth.

In order to milk a doe to best advantage she should be taught to jump upon a milking stand. This stand is sixteen inches high from the ground and fitted with a stanchion, and the work of milking is rendered extremely easy by the use of such an apparatus. To teach a doe to jump on the stand, feed a little grain while milking, and she will soon learn to anticipate this and willingly take her place at the proper time.

Here let me speak a word for kindly treatment towards goats kept in small enclosures. In the first place it is an absolute cruelty to keep but one doe, for goats are creatures of especially gregarious natures and will mourn and fret very considerably if kept alone, whereas two or more will thrive together contentedly.

A provision essential to their needs is something upon which they may jump and play—a good sized box answering their purpose if nothing better can be procured. In their natural wild state they are much given to climbing and jumping from considerable heights, and in order to keep them in healthful condition some provision for such exercise should be provided. If goats are tethered, see that the rope or chain is not unduly heavy, that a wide, comfortable collar is fitted not too tight, and, most important, that a swivel is attached to the tether, otherwise there is serious danger of choking.

Remember that shade is as accept-

Citrus and Tropical Fruits

SELLING FRUIT BY CO-OPERATIVE ASSOCIATIONS.

By G. Harold Powell.

The co-operative associations sell the fruit in a variety of ways, the method of sale depending on the character and condition of the industry and the practices that have grown up around it. A large proportion of the deciduous summer fruits is sold f.o.b. cars at the point of production, subject to inspection on arrival in market, or for cash f.o.b. cars, or at auction. Some are consigned to commission merchants. From 25 to 30 per cent of the citrus fruits of California are sold at public auction in the eastern and central-western markets, and a large proportion of the western deciduous fruits is sold in this manner. Among the apple associations it is a common practice to send to the trade in advance of the harvest a catalogue of the probable number of boxes of the different varieties and sizes of the higher grades of fruit that the association has for sale, and finally to sell the fruit to the highest f.o.b. bidder. The lower grades are consigned to commission firms, are sold for cash, or are marketed in other ways.

Few of the organizations, except those that transact a large business—like the citrus fruit growers of Florida and California, the peach shippers of Georgia, and the deciduous fruit shippers of California—have attempted to regulate the distribution of their products throughout the country, nor have any serious attempts been made to carry the distribution beyond the wholesale dealer, the broker, or the auction companies. The co-operative method has brought about large economies in the purchase of supplies, in the cost of preparing the fruit for shipment, and in the charges for distribution and sale. It has improved the methods of fruit packing and grading enormously. It has sometimes doubled the net returns to the individual grower for his product. The difference in the price that the association receives for the fruit and that which the consumer pays is often 100 per cent or more higher than the original selling price, and this contracts consumption.

As long as the country is prosperous and the present method of distribution and sale does not cause a disastrous oversupply in the principal markets, the growers will be satisfied to continue the methods now in operation. But as the fruit business increases it will be necessary for the growers' associations to develop methods for increasing consumption. This will be accomplished by a more general distribution of their products, by the development of their associations into marketing organizations, by equalizing the distribution of the fruit over a longer period through a greater use of cold storage warehouses, by stimulating a greater interest in fruit consumption through systematic advertising, and by placing the fruit in the consumers' hands at a cost nearer that which the producer himself receives. As the American fruit business increases, the grower may be expected to bring about as great an improvement in the methods of distributing and selling his products to the consumer as he has already accomplished in the handling, grading, packing and preparation of the fruit for market.

AVOCADOS.

Mr. Frank Frost of Success, Tulare County, is anxious for information as to avocado or alligator pears. He has a few hundred small seedlings started and as he is in an almost entirely frostless section, wishes to plant as extensively as is wise. He wishes to know as to best soil conditions and as to whether they will stand with roots in decidedly moist soil; what is the best time for budding? Seedlings are now about a foot high.

The avocado is a new fruit to horticulturists and very definite information cannot be given. Seedlings are unsatisfactory; a few bear good fruit, while many do not bear at all. Therefore budding is necessary. Nurserymen are now experimenting with budding, endeavoring to find best methods. The ring or the patch bud has shown best results, but even with them the percentage of successful buds is very low. Some nurserymen have succeeded best with the ring bud, the bud wood having been forced to ripen buds before cutting from the tree by cutting off a part of the leaf. A little later after a partial recovery from this mutilation the remainder of the leaf is cut off, leaving a part of the stem. This will drop off when the wood is fully ripened, and then the scion may be cut off and the buds used.

As to period of the year, spring time is doubtless the best, but this is a question upon which more definite information can be given later.

Soil and climatic requirements are very similar to those of the orange. If anything, the avocado will stand less frost and is more sensitive to the heat than is the orange. It is supposed that the warmer coast sections offer most favorable location, though it is probable that varieties will be developed which will do well under valley conditions. The soil must be warm and fairly well drained.

ADVERTISING US.

In suggestion for advertising Florida oranges contributed to the Florida Grower we note in almost every paragraph comparison with "California Navels." The suggestions are to the citrus exchange of that state and we doubt its acceptance. We bring up the point to prove the old-time assertion that "Comparisons are odious." Further, the fact that a possible competitor is worthy of being mentioned seven times in a few short paragraphs is high tribute. But worse than all is the fact, and it is generally granted, that when a competitor attempts to depreciate another he does it so that too much attention may not be centered on his own product. But here are the suggestions:

"I would suggest that a series of cards on good bank paper be printed for wide distribution among all retailers who sell Florida oranges. I am listing below some suggestions for cards that might prove suitable:

"Florida oranges contain 41 per cent more juice than California navels. The juice contains the only nutriment in the orange. A box of Florida oranges is 15 per cent larger than the standard California box. Moral: Buy Florida oranges. Buy the box and get practically twice as much juice for the same money. Ask your dealer for Orangeade recipe.

"A standard box of California navels weighs about 72 pounds and contains about three gallons of juice. A standard box of Florida oranges weighs about 85 to 100 pounds and contains from 4¼ to 5 gallons of juice. Insist on Florida oranges. Get full value for your money. Nine Florida oranges are equivalent to about a dozen California oranges.

"A California navel may look prettier, but beauty is only skin deep. For the best flavor and nutriment buy Florida oranges and get 41 per cent more juice and a 15 per cent larger box. The juice is the only nutritive part of the orange.

"The Florida orange contains 41 per cent more juice than the California navel. Only the juice contains any food value. The best way to eat an orange is to drink the juice.

"Ask for the Florida orange, which contains 41 per cent more juice than the California navel—not to mention the better flavor of the Florida product."

Doctor F. H. Newell, to whom the success of the reclamation service is due in a large measure, states that over 1,000,000 acres have been reclaimed and 14,000 families are receiving water from works built or controlled by the government under the terms of the reclamation act.

Chicago potatoes are selling at 75 cents a peck, and many people decided to leave potatoes off the menu for a while; as a result of this the incoming supply accumulated until wholesalers were forced to cut prices some, in order to get rid of the overstock.

Every Orange Grower in California

and every other user of

FUMIGATION CYANIDE

should be well advised before purchasing his supply.

The best authorities unanimously agree that for the effectual generation of Hydrocyanic acid gas, a Cyanide should not contain in excess of 1 per cent of Chloride of Sodium (common salt). A higher percentage of the ingredient materially reduces the available amount of gas by the process of decomposition.

BEWARE OF ADULTERATED CYANIDES!

Inferior and so-called Cyanide of Potassium is sometimes offered the uninformed at a price below the market.

In nearly every instance it proves to be nothing more than a low-grade sodium cyanide carrying from 7% to 15% Sodium Chloride—such cyanide bears no manufacturer's brand or label.

Best Fumigation Cyanide is Cheapest

The best fumigation cyanides do not contain over one per cent Sodium Chloride.

Cyanides sold for less than the market price generally contain from 7% to 15% sodium chloride, which is a dangerous element and robs your cyanide of its true efficiency. Furthermore, an extreme sodium chloride content causes twice the percentage of its own inaction.

Facts Orange Growers Should Know

That the only eradicator of San Jose Scale and other insect pests is in the use of a fumigation from Hydrocyanic Acid gas, generated from cyanide of Potassium 98-99% or Cyanide of Sodium 128-130%.

That it is endorsed by Agricultural Experiment Stations.

That it is worth your while to know the sodium chloride content of the cyanide you purchase and if in doubt have a reputable chemist furnish an analysis.

Only One Eradicator of San Jose Scale

Fumigation from Hydrocyanic Acid Gas generated from

Cyanide of Potassium 98 99%

or Cyanide of Sodium 128 130%

the only positive eradicator of San Jose Scale and other insect pests affecting citrus and deciduous trees.

ENDORSED BY AGRICULTURAL EXPERIMENT STATIONS

AND IS THE

Kind of Cyanide to Use

The Roessler & Hasslacher Chemical Company's Guaranteed Cyanide of Potassium (98-99 per cent) and High Test (128-130 per cent) Cyanide of Sodium are manufactured expressly for fumigating and contain no reactionary chemicals. The manufacturers of this material have studied the requirements necessary to produce definite and dependable results.

IT GENERATES QUICKLY, affording the required degree of density of gas under the tent.

CONTAINS NO CHLORIDE OF SODIUM, insuring the highest efficiency and maximum evolution of Hydrocyanic acid gas.

F. W. BRAUN

363-371 New High Street, Los Angeles, Cal.

DISTRIBUTING AGENT FOR

The Roessler & Hasslacher Chem. Co.'s Special Fumigating Cyanides

Packed Only in 200 Pound Cases

Growers Should Co-operate

Through recent investigation it has been proven that a considerable amount of low grade sodium cyanide is on the market. It is probable that some concerted action may be taken by the growers to protect themselves in the purchase of this inferior quality. Analysis by local chemists shows some of the cyanide to contain as high as 15% Sodium Chloride.

Prof. R. S. Woglum contends that a fumigation cyanide containing in excess of one per cent of sodium chloride is unfit for use.

What Salt does to Cyanide

Sodium Chloride, or common salt in Cyanide causes twice the percentage of its own inaction, thereby greatly reducing the efficiency of your fumigating Cyanide.

That an unusual amount of "salted" or diluted cyanide is now on the market has been proven.

If you have reason to doubt the quality of the next cyanide you purchase, you should insist upon an analysis. Its true chemical content is vitally important and should not show over one per cent of sodium chloride.

F. H. Hammer Manager

To the Water Well Owners and Drillers of Southern California

We beg to introduce ourselves and ask for a chance to prove worthy of your permanent confidence and patronage.

We have found that with some additions, the complete line of oil well supplies which we carry at Los Angeles and in our branch stores, is admirably adapted to supply the needs of the water well trade, and we are entering this field with all the vim and vigor which have built up our immense oil well business in the past five years.

If you are in need of an engine, pumping outfit, casing, belting, tools (small or large), pipe, fittings or supplies of any kind, we will be more than pleased to serve you. You will find our goods of the better grade only, our delivery prompt, and our prices the very lowest, consistent with first quality.

We will take pleasure in supplying any quotations or other information you may desire and will appreciate an opportunity of making your acquaintance.

Ask for our special bulletins on water well supplies. Mailed free.

Deciduous Fruit Culture

THE HORTICULTURIST'S MISSION.

The world was but a wilderness
Till art's celestial birth
Spread culture, like a robe of light,
O'er all the joyful earth.

Wild grasses waved their scanty store
Over the untilled plain,
That now with life and bounty filled,
Bend down their ripened grain.

The wild-wood briar waited long
For love, that should disclose,
By Art's sweet power, from meager buds
The full and blushing rose.

Sour grew the rough and stunted crab
Within the thorn tree's shade;
Where now, amid the glancing leaves,
Through Culture's magic aid—

Swells forth the Apple's glowing cheek,,
With juices rich and rare,
And hangs with melting nectar filled,
The tempting golden Pear.

And, in the Future's brightening years,
Progression's law divine.
Unfolding still, with still new charms,
Shall make the landscape shine.

So that the day shall never dawn,
In which still fairer flowers
And fruits more luscious, shall not come
To bless this world of ours.

Then rosy Hope, with heaven-eyed Faith,
Shall cheer our labors wise,
Till this once rough, dark wilderness
Shall change to Paradise.
—Ohio St. Univ. Bulletin.

COMMERCIAL VALUE OF FRUITS.

Several questions have come up that involve the general subject of the commercial value of apples and other fruits. What constitutes their commercial value, what varieties are suited to be grown for market in certain sections or soils and what are the means of knowing which to plant are all questions of material value.

What Is a Commercial Fruit?

In short, it is one that will sell. The most prominent characteristic of all that attracts the average buyer is appearance. Although there may be other points of value that attract special customers who know them, the ordinary buyer uses his sight more than any other of the senses. This is entirely natural and we cannot blame him any more than we can blame the honey bee for hovering about the bright colored flowers, although they may not be able to get honey from them. The Ben Davis apple is a good illustration of this fact. I was in New York city lately and as I had the opportunity to see what was for sale and at what prices, on the fruit stands, I stopped at a number of them. At several of them I saw Ben Davis and Newtown apples of the same sizes selling for the same prices. The most of them were from the Pacific coast and those of about two and one-half inches in diameter were bringing five cents each, with the miserable Ben Davis selling more readily than the Newtown of very much better quality. The brighter red color did it. It is almost useless for the dealers to take the time and trouble to tell their customers about the better qualities of inferior looking varieties. They will rarely believe it and if they do they will often decide in favor of beauty as against quality.

The condition in which fruits are packed and presented to the customers has much to do with their appearance. Those which are not really first-class in appearance may be made to look much better than they really are by having them clean and neatly arranged in attractive packages. Too much care in this respect can scarcely be used. Freedom from decay, bruises and other defects is also important.

Of course the flavor is a part of the market value of any fruit and with the most intelligent consumers it is considered above all else. The eating is the final and most important test to all and to this we should try to bring both the grower and consumer to agree.

Size is another factor and is really a part of appearance. While the largest varieties of fruits are not often the best, the larger sizes of any given variety grown in one locality are usually better in flavor than the smaller ones. They are better developed and have had better opportunity for attaining their normal flavor.—H. E. Van Deman in Green's Fruit Grower.

THE STANDARD.

Luther Burbank states that in his opinion, and it is supported by a number of large growers, he has now "the best prune ever produced." It is a combination of the Tragedy and the Sugar prune and he states that "the trees are enormous and never failing bearers and good healthy growers."

It was our pleasure this week, by the courtesy of Mr. Geo. C. Roeding of Fresno, to test this new variety, the fruit of which is very large, thick-meated, and small pitted. The fruits sent to this office measured four and a half inches in circumference the small way and nearly six inches the long way. Skin is purple with a very heavy blue bloom, flesh amber or honey yellow, fine grained, and if anything rather firmer meated than most of the drying prunes, and a perfect freestone.

While at Mr. Burbank's home a few weeks ago, we tasted the dried fruit and found it exceptionally fine eating. It seemed hardly as rich as the ordinary French prune, but we note in an analysis of the Standard furnished by Mr. Burbank that it shows a percentage of sugar of 18.9, whereas the average French prune shows 18.5. In percentage of flesh it also shows a gain over the French prune, the proportion being 96.5 to 94.2. This is perhaps more forcibly shown by comparative percentages of pit to fruit; in the French prune 5.8, in the Standard 3.5.

SCORE FOR WATSONVILLE APPLE SHOW.

The management of the State Apple Show at Watsonville has settled on the following system of scoring for this year's exhibits:

Perfect score will be 1000 points, divided as follows: Six hundred for perfect fruit, 100 for uniform size, 100 for color, 200 for perfect pack. In judging, 40 points will be allowed for bulge, 40 for alignment, 40 for height at ends, 40 for compactness and 40 for attractiveness and style of pack. For each wormy apple 40 points will be deducted, for other imperfections such as scab or scale eight points will be taken off. Other things being equal, the straight 4-tier pack will be given preference in the carload exhibits. No distinction will be made between 4-tier, 3½-tier and 3-tier pack in smaller lots. All varieties will compete for sweepstakes prizes on an equal basis.

Mr. W. R. Shively of Upper Lake reports as to crop conditions in Sonoma County: Cloverdale grape crop approximately three-fourths; Windsor, Geyserville and Cloverdale prunes, 90 per cent. The same sections will have fully 75 per cent of a hop crop. Geyserville grapes are running 85 per cent and peaches 65. The Ukiah hop section is coming on fine with 90 per cent of normal crop.

The last census figures offer a showing of 4,183,600 more hogs killed in this country for food purposes than all the other animals combined, including beeves, calves, sheep, lambs and goats.

Bluegrass, when the season is favorable, is a very profitable crop. Last year it sold for from $7 to $10 a bushel; there being so little, farmers practically commanded their own prices.

The city of Chicago eats approximately 4,000,000 cantaloupes a week, from July 1 to September 15.

Apples are selling at 20 cents apiece in Europe, which takes kindly to the western fruit of the United States.

SPECIAL FLOWER SEED COLLECTION

WE will mail you a package of FLOWER SEEDS containing a dozen or more old-fashioned hardy Annuals, such as PHLOX, POPPIES, CANDYTUFT, MARIGOLD, COSMOS, MIGNONETTE, Etc.

You can sow this package of choice seeds in out-of-the-way corners of the garden, in odd beds around young trees or on embankments and with little cultivation you will have a mass of gorgeous and continuous blooms, sweetly fragrant, all through summer, till killed by frost.

This package will be sent to any address for 10c. in stamps or coin. Write Dept. A

Bees and Their Care

MARKETING THE CALIFORNIA HONEY CROP.

Why Western Honeys Are in Demand in the Eastern Market.

By Ralph Benton.

In a recent issue of The Cultivator (August 17th) we made the statement that there are perhaps three outstanding reasons why the citrus market stands fast and keeps pace with the increased production of the industry behind the market; and the first of these reasons we named as ripe fruit. We dwelt somewhat upon the necessity of ripe honey as a first essential to successful marketing. The other two reasons why the citrus growers are so successful in marketing their crops are: firstly, concerted and persistent advertising, and second, an effective channel of distribution, i. e., the Citrus Exchange. It is astounding the wholesale advertising schemes that California is carrying on. We sometimes wonder if it is not being overdone; but everyone who comes to the coast seems to get the fever, and so the enterprise goes on. The secret of this successful campaign probably lies in that the advertisers always manage to make good. We are a firm believer in continued and systematic advertising; but an equally firm believer that after all is said the best advertisement for an article is an invariably high grade product a little bit better than can be produced anywhere else. We shall have more to say later about systematic advertising and a California honey exchange. Here we wish to discuss why it is a safe proposition for the California honey producers to launch a concerted and extensive advertising campaign for their product coupled with a well organized producers distributing agency—in other words, why Western honeys are in demand in the Eastern markets — why California honey is in demand in the markets of the world. In our former paper we presented a table of figures showing the relative composition of flower nectar and different types of honey. We herewith present again these tabulations as there are some features in the composition of the several types of honey that will help to make plain the position of California honeys in the market.

diseases, and, finally and most important of all, the exudations of plant lice and scale insects. Aphids and scale insects take large quantities of plant juices containing sugar into their systems and, accumulating more cane sugar than they can take care of, exude this superabundance of food material in the form of honey-dew. Plant lice are perhaps a more important source of honey-dew than are the scale insects, as the former are provided with regular tubes for the escape of such fluids, which frequently may be seen falling in fine mists from aphid infested trees such as poplars, pepper trees, native walnuts and apple trees in the orchard. These exudations, rich in sugar, are attractive to nectar loving insects, chief among which are ants and bees. This explains why ants are so frequently found associated with scale insects and plant lice. The ants do no direct injury, but indirectly facilitate the destructive work of the scales and particularly that of the plant lice by transporting the latter from place to place as new and fresh supplies of food are needed for their "milch cows," as the aphids have been termed by the student of ants.

Honey-dew, before it is gathered by the bees, is as it falls on the leaves and other parts of trees, open to contamination by bacteria and certain fungi which flourish in these dilute and sweetish fluids, elaborating oils and gums which in a chemical analysis of honey-dew raise the dextrin and ash content of such honeys away beyond the three per cent of the standard honey of the chemist and brand such products as "abnormal honeys" before the pure food law. These oils and gums are not only a source of trouble to the honey producer, but are also injurious to the tree and exceedingly troublesome to the orchardist, as anyone who is familiar with the smut of black scale, say on the olive tree, can testify.

Again, the tendency for honey-dew to ferment is a source of difficulty both to the producer and the handler of honey; and this tendency seems to be recognized by the bees and, no doubt, partly explains why the formic acid content of honey-dew is so large in contrast to the content of the average honey, which is only about half as great. We say partly explains, for

Type	Water	Invert Sugar	Cane Sugar	Ash	Dextrine	Formic Acid	Undetermined
Flower nectar	76.00	9.00	12.00	.25	2.75	.....	.....
Chemists standard	25.00	64.00	8.00	.25	2.75	Tr.	.....
Average for America	17.59	74.52	1.98	.23	2.09	.09	3.61
Poplar honey	17.02	65.80	3.10	.76	10.19	.19	2.94
Honey dew	15.46	64.84	5.27	1.29	10.01	.15	2.98
		As Levulose	As Dextrose				
Alfalfa	16.56	40.24	36.85	4.42	.07	.34	.08	1.43
Sage	16.43	42.75	31.22	3.39	.07	.62	.06	5.52

Abnormal Honey or Honey-Dew Honey.

It will be noted in the tabulations given that poplar honey, taken as a type of tree honey, and honey-dew, aside from being some 8 per cent to 10 per cent lower in sugar content than the average American honeys, run some 8 per cent higher in ash, dextrin and formic acid content than permissible in the chemist's standard. This is why these products of the apiary and all products from similar sources are branded as "abnormal honeys" and under the pure food law have to be labeled as "honey and honey-dew honey," or simply "honey-dew." For the general reader it may be in place to explain the distinction to be made between honey and honey-dew. Honey is the sweet produced from floral nectar, i. e., the nectar secreted by flowers or its parts, as modified by the bee and conforming to the standard recognized by the Association of American Chemists. Honey-dew is the extra-floral secretions of the plant, i. e., sweetish fluids secreted from the surfaces of leaves, from the stem about the stipules of such plants as the bean, oozings from trees caused from mechanical injuries or the attacks of bacterial or fungous

very likely at least some of the high percentage of formic acid enters in because of the extra working over which the bees give honey-dew on account of its large cane sugar and dextrin content. The presence of formic acid in such relatively large quantity makes honey-dew unsuitable for use as food by persons highly susceptible to bee stings and the use of even milder honey; and in fact its strong character, due in a large measure to the dextrin content, relegates these abnormal honeys either to the vinegar barrel, where a colored honey is commercially desirable, or to bakery use, where a dark and aromatic honey is usually used.

Why Buyers Desire Alfalfa Honey for Their Bakery Trade.

The bakery trade not only prefers a somewhat darker and aromatic honey, but demands first of all a Western honey because of its low water content, and alfalfa honey because of its high sugar content. Western honeys from the arid regions, which includes portions of California, average three per cent lower in water content than the honeys produced in the extended honey belt of the upper Mississippi Valley. It is also true of East-

Egg-More

The biggest egg producing food made. Not merely a strong tonic, which is not advisable to be fed regularly, but a FOOD, highly concentrated and very rich in protein. EGG-MORE mixed in proportion of one pound to 6 lbs. of good ground grain feed will keep the fowls in good health, maintain a strong and vigorous system, make the hen molt early, feather out quickly and convert the protein into eggs. It has been doing just that for six years, and each year the sales have greatly increased. It is the biggest selling poultry food on the market today. 4 lb. package, 35c; 12½ lb. sack, 90c; 25 lbs., $1.65; 50 lbs., $3.00; 100 lbs., $5.50. We pay freight within 200 miles on sack of 25 lbs. or over. Send for EGG-MORE BOOKLET.

Profit in the Poultry Yard

Practical poultry people who may have ideas from their experience as to methods of feeding and housing and general care of poultry will confer a favor upon the Cultivator and its circle of readers by sending in concise accounts. Mrs. Basley is always willing to answer queries, which with the experience of others should make this a most valuable feature in poultry life on the Coast. Opinions or matters of a personal nature should be omitted, but a concise statement of facts is always valuable.

DIPPING FOWLS FOR LICE.

It is generally agreed that lice and mites must be combated by the use of liquid or sprayed applications to the perches, buildings, nests and coops, while applications to the fowls themselves, if made at all, must be in the form of powders. The only exception which is frequently made in practice is in using lard or other grease on the heads of little chicks.

Dust Bath.

Granting that the dust bath is the natural means by which body lice are to be combated, it is still true that, by reason of wet weather, or other conditions, we frequently find more lice on chicks which have free range than we like to see, and early pullets not infrequently bring into winter quarters with them more lice than the winter dust bath will overcome. Where fowls are kept in large numbers, it is practically out of the question to dust each one thoroughly by hand, and the desirability of some more rapid method of individual treatment is unquestionable.

Dips seem such unnatural remedies that we are justified in trying them very cautiously, and the "wet hen" is a proverbially unhappy creature. It may also be thought that there would be no saving of time by dipping as compared with dusting, but in practice I think that the dipping will be found much more rapid, even though it be understood that the dip must be worked through the feathers with the fingers.

Two or three years ago one of the western experiment stations stated that the ordinary kerosene emulsion used for garden spraying could be safely and effectively used as a dip for poultry if reduced to a 10 per cent strength. This I have never tried, though I should not fear bad results from its use under conditions which would make any dipping safe; but this past winter I have had an opportunity to see the beneficial results of careful dipping with another mixture.

The Dip Worked.

One of my neighbors found last summer that his growing chicks were suffering with lice, and after trying lard, powders, and everything which the genius of the oldest inhabitant could suggest, he resorted to a dip which is a proprietary preparation, but evidently based on carbolic acid and a coal-tar or creosote combination. This mixture is especially prepared for spraying walls, painting perches, etc., but the maker was sure it could be safely used on the fowls themselves, and suggested what he considered the proper strength. This was tried, with the result that the first dozen chicks dipped were dead within a very short time, and the hands of the operator were nearly raw. The solution was diluted to about one-fifth the strength recommended and the dipping resumed, with the result that the chicks seemed to suffer no more serious inconvenience than from any other thorough soaking. The dip was well-worked through all the feathers, and the lice practically disappeared.

Just after the older pullets had been put into winter quarters it was found that lice were again multiplying, and about 100 of these birds were again thoroughly soaked and kept in a room with a stove and a good fire for about two days, as the weather was cold and the pullets were already laying and were depended upon for winter eggs. No bad effects were seen as a result of this dipping, and the laying was checked no more than might have been accounted for by the changes and excitement incident to the dipping and drying.

Effect Remains.

Shortly after the pullets were dipped six cockerels were put with them which had not been treated. I handled a number of them the last week in December and noted that the males were lousy and the females apparently free from lice. My neighbor was burned out soon after, and I bought this flock, which was of pure Barred Plymouth Rocks, and put them in a new building, of which they were the first tenants. From time to time I noted the almost perfect freedom of the pullets from body lice. Some were killed, and in scalding for picking the odor of the carbolic dip used three months before was always very pronounced, although it was not noticeable on the living fowl. These fowls were kept under cover until spring opened, so I cannot say whether the effects would have been so lasting if they had been exposed to the weather. Up to the present time, about four months after the dipping, there are hardly any lice to be found on those pullets.

I am not writing this to advocate the purchase of quack poultry remedies, especially as the people who put up this material did not know what strength could be safely used on the fowls, but it does seem to me to point the way to a practicable source of relief in many cases where immediate and effectual treatment is demanded. The fact once established that the carbolic or creosote dips can be safely and effectually used, it becomes a matter which any intelligent man can work out for himself, to determine just what strength to use for different ages and conditions, and in warm weather there is little or no danger in giving a hen or chick a thorough soaking if it is not done until the sun is high, so that they will dry rapidly and without too much chilling.

The chief advantage of this treatment over dusting is its greater period of efficiency, for no dusting can render a fowl distasteful to vermin for as much as four months at a time. In fact, it is not easy to make a powder adhere to a half-grown chick on free range so as to be percentible the next day, and the benefit is chiefly the smothering of the lice which happen to be covered with the dust at the time of application.

I may add that in the case of these pullets which have been under my observation, there was no sticking together of the feathers nor any outward evidence that they had been dipped. On the contrary, they were an unusually clean and attractive lot, and have laid eggs all winter which have shown a higher percentage of fertility than is usually found in cold weather.—Country Gentleman.

SAVING MONEY ON FARM EGGS.

Improper and antiquated methods of handling eggs in the United States result in losses that reach an estimated total of $45,000,000 annually. This is 17 per cent of the estimated total value of the entire crop. Practically all this loss is borne by farmers and other producers, and a large part of it can be prevented. How the Department of Agriculture through its Bureau of Animal Industry is solving this problem is told in Bulletin 141 just issued, entitled "The Improvement of the Farm Egg."

In order to show how this loss might be prevented, the Bureau of Animal Industry last year sent experts into Kansas to conduct investigations. The results of the first season's work are given in detail in the bulletin with suggestions for improvement that may be applied anywhere. "Although but one season has been spent by the Bureau in this work," says the bulletin, "several much-desired changes have been brought about. The most important of these was the adoption by shippers of the 'loss-off' system of buying and selling eggs."

Previous to the work of the bureau Kansas eggs were not very popular in the markets outside the state. Quantity rather than quality was a handicap the shippers encountered. The immediate effect of buying on "loss-off" system produced such a marked change in the quality of the eggs reaching the market that outside buyers now manifest a preference for eggs bought in this manner.

COULSON'S POULTRY FOOD MADE IN PETALUMA

A Successful Poultry Season is Now Opening

For a number of years we have kept a close watch on the poultry business. We have analyzed conditions relative to egg prices and market demand. Each year the poultry business has taken on a more vigorous tone. As advanced methods have come into use, and the population of the state increased, so the poultry business has shown a greater volume.

We Have Seen Small Beginnings Made With 100 to 200 Chickens Come to be Large and Flourishing Poultry Ranches

Success in poultry raising is largely a matter of food. It is a question of securing the best at the right price. After we have been mixing and feeding food for years, we have learned much that is of vital interest to the poultry raisers of California. In the purchase of various ingredients composing our food we are particular to get ONLY THE BEST. This policy has resulted in producing a food that has no equal on the market. It is the food that has made the poultry business the big factor it is today in California.

C-O-U-L-S-O-N'S Our Poultry Food Insures Success

TO THE BEGINNER: If you are considering entering the poultry business either commercially or for fancy poultry we want to send you our books of instruction. They give instruction as to housing, feeding and general care; they describe diseases and tell how to avoid them, or cure them if they get a start; they describe various lice, bugs, etc., that infest poultry; in short, you can have the whole story free by sending us your name and address.

TO THE COMMERCIAL POULTRYMAN: We can supply our food in ton and car lots at prices less than you can procure and mix the various ingredients. Let us explain how we can save you time and money. Write us your requirements and we will submit a proposition which will interest you. Our instruction books will be found interesting to you.

TO THE FANCY POULTRYMAN: If you value good stock don't feed poor food. Buy the best. Our food will keep your birds in prize-winning condition, give them tone and natural vigor and keep them in perfect health.

At This Season Feed

COULSON'S EGG FOOD MADE IN PETALUMA

to your hens and maturing pullets. This food will pay for itself many times over in increased egg production.

We have made it easy to secure our food, by establishing agencies in every poultry center. You will find a complete supply on hand at all times.

COULSON'S FOOD MADE IN PETALUMA

Get in line for a big season—the biggest ever. Feed a successful food, care for your hens, keep their quarters clean, avoid drafts, and you can count on a profitable season.

Live Stock and Dairy

Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.

HORSES.

By Mrs. M. E. Sherman.

The snap that a thoroughbred sire passes to his colts is a desirable quality in a driving horse. The horse that skips happily down the road with head erect, ears pointed forward, seeing everything, is a pleasant companion to while away the tedium of the road. I doubt if ever there is a greater pleasure than driving a good horse with a firm, light hand, as he goes merrily down the road. Even Shakespeare would not have touched the feeling of comradeship if the cry of the king had been "My kingdom for a motorcycle." The poor king wanted the courage and affection of a good horse to help him escape, not only his enemies, but to escape from the mental overthrow and defeat.

Half Breeds.

The demi-sang, as the French call them, have great endurance and plenty of ginger, while their size, increased by the use of the large dam, enables them to handle heavier carriages. These demi-sang or half bloods have great intelligence and are apt to be level headed in a crush, even if they are high temepred at other times. A woman can readily handle them, for they are like someone else that she knows well how to manage. Both are handled with the silver bit and the silken reins of affection. The demi-sang came into direct use to supply the need for a larger sized animal of quick action. A further attempt to give more weight and size with ability to handle loads at a trot has given us other strains between the roadster and the draft animal.

Express Type.

The coach type when pure bred makes a desirable carriage horse. These same sires make a good cross on commoner mares for express horses. The Cleveland Bay was brought from England to supply horses of style and weight. Germany and Belgium, also, sent good coach horses to America for the same purpose, while the French Coacher was smaller and more speedy, rather in the roadster type. The old farmer used to say in using these horses: "If the colt is a saddle or carriage animal I will secure a fancy price, but if it is not, it will still be a good work horse." The reason these crosses did not give California more of these useful animals is that the people were too impatient. The aged or mature stallion or bull must be acclimated before they are certain as breeders. It is safer to bring yearlings to California and await their development than to bring the older animals. It is just about as quick in return in most cases. The farmers are disgusted with animals brought here for breeders, and it is not uncommon to hear them say that they are "no good."

They often regard all imported animals as luxuries of the rich, and wait to see them proven before accepting them as valuable. The mares bred to the finest imported horse were often of a weedy type. The farmer that had a pure bred mare had to pay more than one that had a scrub to breed. This has seemed, to anyone interested in stock, as a backward movement to encourage the use of cheap mares rather than of good ones. We have used the demi-sang mares, and have had good success with the crosses of Cleveland Bay, Hackney, French and German Coach horses. The English Hackney did not appeal to the farmers of Fresno County when Fulton Berry brought Paragon here some years ago. We had several good colts from him, but the trappy action did not suit the Cailfornia buyers. Pat remarked of one of these animals: "W'at's the use of a horse thot trots all day in the shade o' a tree?"

Thoroughbreds.

We all of us sometimes misuse words of our language, and we are all in turn pained by the misuse of pet words of our own. The word thoroughbred, as used and written by some of us as descriptive of cows, pigs, sheep, goats, dogs, cats and chickens, is rather awful to the rest of us. The use in extreme case I noticed in an agricultural paper where the editor had allowed an advertiser the privilege of using his columns with the announcement of a thoroughbred Percheron for sale. The thoroughbred Jersey and Holstein cow has long been a familiar example of this kind of mixing up of words. Remember there is but one animal that is a thoroughbred, and that is a running horse descended from Arab or Barb ancestry. Tradition tells us these animals were imported, often both sexes, and again a certain number of the fleetest English mares were used in the mating. The actual beginnings were early in 1800, when the first horses' and mares' pedigrees were put down in the stud book kept by the official agent of the Jockey Club of England. The first volume was issued in 1808. While there are no doubt many fanciful pedigrees in the breeding of the first animals, yet by this time the cold blood has been overwhelmed in the general goodness, and the race of running horses can be relied on to transmit certain qualities and also their physical characteristics to their offspring. The only animals now admitted to the stud book are those whose sire and dam are both recorded.

Every pure race of animals has its book of official record that gives the number to the offspring of animals that are already recorded. These animals of other breeds, herd or stud books are called pure bred, full bloods, registered or standard bred according to the particular terms used by the association or society that holds the books of record.

The standard bred horse includes the trotters and pacers and is of American origin. There is a heavy strain of thoroughbred blood in many of the trotting animals, yet many of the animals entering into the Standard book had to qualify by showing speed. The old strains of trotting stock of Gray Eagles, Clays, Hambleton, and later Wilkes and many others, including our own McKinney, have added luster to the Standard trotters.

GIVING THE SWISS MILCH GOAT A WELCOME TO CALIFORNIA.

(Continued from Page 265.)

able to an animal for relief from a broiling sun as to ourselves. Again, wandering dogs are a menace to staked does, and I have known of several instances where the helpless creatures were killed by vicious dogs. Another wrong is to ship a doe in milk a journey greater than twelve hours when no provision for milking her can be assured. The only time does can safely be shipped is when they are dry, and it is most unwise to ship a pregnant doe that has passed the second month since being bred. When shipping goats, they will stand the journey best if more than one can travel in the same shipment, though not necessarily in the same crate. The crates should be comfortably large and provided with bedding, hay in a sack fastened to outside of crate, a pail of water, and full directions for feeding and watering while en route.

Should goats scour, one of the best and simplest remedies is a feed or two of fresh live oak leaves, which quickly act as an astringent.

Hornless goats are far preferable to those with horns, and it is well worth while to dehorn horned kids. This may successfully be done by applying caustic potash to the buds when the kid is two days old. If not treated until the kid is several days of age, it is almost impossible to destroy the growth. We find the best method is to use a small swab well saturated

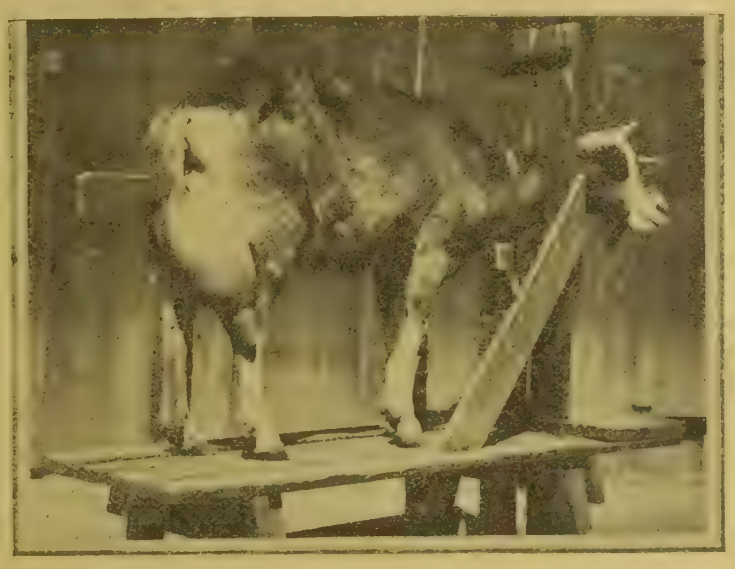
with the caustic, made liquid with a few drops of water. The greatest care must be exercised to prevent any caustic getting into the kid's eyes. To avoid this, rub oil or grease in a circle around the base of horns before applying the caustic, but if the oil touches the buds the caustic will have no effect.

First cut the hair immediately touching the base of the buds, rub the oil far enough away not to touch the buds, and with the swab apply the caustic generously to the base of the buds. Hold the kid for ten or fifteen minutes to prevent it scratching its head. If necessary, repeat this operation once or twice on following days.

An average Toggenburg doe yields between three and four quarts of milk daily, and in some instances they may approach very close to the five quart mark. Their period of lactation is the same as that of a good cow. We consider two months rest during the year a proper interval for them to remain dry. The half grade Toggenburgs are in rare cases almost equal to the thoroughbreds in milking capacity, but as a rule they may be considered about half as good, and as the infusion of Toggenburg blood increases from generation to generation, the quality of the grades increases proportionately.

Our famous imported "Fanette" made in one season the great record of 1,709 pounds of milk; kidding Feb. 8, 1909, buck and doe kids. Her record was begun Feb. 14, and the milk



Imported Toggenburg doe "Fanette" in milking stand. Registry No. 151 in A. M. G. R. A. Made grand record of 1709 pounds milk in one season. Owned by Winthrop Howland, Rancho El Chivar, Redlands.

most carefully weighed morning and night until she was dried off Jan. 29, 1910. Her greatest daily yield was 9 pounds 10 ounces, her greatest weekly yield 63 pounds 11 ounces, and her greatest monthly yield 247 pounds 6 ounces.

This record was made on range feed, mostly of weeds, with less than a pint of grain additional per day. Had she been stall fed and forced, her yield could have been materially increased.

Our Toggenburg doe "Griselda," bred in California, yields 8 pounds 7 ounces of milk per day, and an exceptionally fine grade doe is good for 7 pounds 8 ounces.

We sometimes hear of does yielding as high as six and seven quarts of milk per day, but this is simply exaggeration, and Peggler, the English authority on milch goats, says he has yet to see the doe that can exceed five quarts or ten pounds per day.

The only accurate way to secure a record of milk yield is by weight, a pound equalling one pint, for it is possible by milking into a small vessel such as a quart measure, and measuring foam together with the milk, to greatly exaggerate a yield, even though the intent of the milker be honest.

Butter, as well as most delicious cream cheeses, are products of goat dairying, and the family wishing to provide these may by keeping two or three good does easily supply the table with both. It is estimated that from five to seven goats may be kept at the expense of one cow.

To further the interest in milch goats the American Milch Goat Record Association keeps a careful record of all eligible goats owners may care to have registered in its books. Does yielding a minimum of two quarts daily are eligible to registration, no matter of what strain, and thoroughbreds may be registered as kids, provided the names and pedigrees of both parents are already entered upon the books of the association.

The members of this association are exceedingly fortunate in having as secretary a gentleman of the sterling qualifications and devotion to the interest of the industry as is Mr. J. C. Darst, of Dayton, Ohio. Under the secretaryship of Mr. Darst the association has grown and prospered in a most satisfactory manner.

Often there are offered for sale goats advertised as Toggenburgs that upon investigation are found to be one-quarter or one-half Toggenburg grades only.

In buying stock it is best to request a pedigree, and if the goat is a thoroughbred the purchaser should receive its properly signed certificate of registration in the A. M. G. R. A.

The following works on the subject of milch goats are considered as standard authority and are of great assistance to the breeder: "The Book of the Goat," by H. G. Holmes Pegler, Hon. Sec. of the British Goat Society, published by L. Upcott Gill, Bazar Buildings, Drury Lane, W. C., London, England; "The Case for the Goat," by "Home Counties," published by E. P. Dutton & Co., New York City; and U. S. Bureau of Animal Industry, Bulletin No. 68, entitled "Information Concerning the Milch Goats."

It is a surprising fact that a people so progressive as Americans have neglected to take advantage of milch goats as have the nations of Europe. Throughout Switzerland, France, Germany, Belgium, Spain, Italy, Norway and Sweden, England and Ireland, the goat is highly prized for its health giving milk, and in these lands the hardy peasants are able to benefit from its keep, whereas they would in many cases be unable to afford that of the cow. So highly are the Toggenburgs valued that in one season ten thousand dollars worth of this breed were exported from Switzerland.

At present there are few representatives of pure Swiss stock in the United States, but those here are highly prized, and among them are some of most valuable strain.

Considering that goats are far more economical to keep than cows, may be easily handled by women and children, are much cleaner and pleasanter to milk on account of their short tails and for the fact that they are but little bothered by flies, as the herds increase in this country we may expect to see these thrifty little dairy animals supplanting to a great extent our old friend, the cow.

Following is an analysis of goat's milk and cow's milk taken from "The Case for the Goat":

	Goat's Milk.	Cow's Milk.
Water	83.21	87.56
Butterfat	7.30	3.63
Casein	4.18	.....
Milk sugar	4.10	8.81
Ash	1.21	.....

"Buy the Best Milk Producer in the world, sugar beet pulp at 50 cents per ton, of Los Alamitos Sugar factory."

FARMERS NATIONAL CONGRESS.

The next session of the Farmers National Congress will be held in Columbus, Ohio, October 12-16. Governor Harmon of Ohio, Gifford Pinchot and other noted speakers will be present.

STATE FAIR.

The total receipts of the fiftieth California State Fair were $33,750, a falling off from the 1910 total of over $19,000. The expenses, like the receipts, however, were much lighter than last year. The biggest day was Wednesday, August 31, with $6,522 gate receipts.

RIVERS AND HARBORS.

The next convention of the National Rivers and Harbors Congress will be held in the city of Washington the first week of December. Noted speakers will be present and deliver addresses on the development of water ways, but more especially on the conservation of water power and the reclamation of land through drainage.

IRRIGATION IN MONTANA.

Montana has not been generally considered an irrigated state, but the 1910 census shows 8,970 irrigated farms, an increase of nearly 12 per cent in the decade. The most pronounced favorable feature in Montana's agricultural statistics is the great increase in number of farmers, almost double that reported in 1900. Acreage irrigated from flowing wells is only 207, but from pumped water, 8,023. The pumping capacity, expressed in horse power, was 3,057.

DATA FOR COMMISSION.

The California Highway Commission has requested filing with it of complete maps of every county in the state, together with suggested routes for state highway work and data as to population and assessed value of all towns. The commission has a difficult problem in constructing roads which will be acceptable to every county in the state and come within the limits of its $18,000,000.

BACK TO THE FARM.

An organization has been formed in Chicago, the object of which is to "bring together the man and the land." It is composed of immigration officials of various states, and its purpose is to in every way aid "all worthy persons in securing both home and employment, but in no event shall we in any way encourage any plan of importing foreign laborers to our shores, but rather care for, teach and assist those on American soil." Statistics on each state's resources will be gathered, and encouraging back to the farm clubs will be features of the work.

COOPERATIVE TESTING.

The Pennsylvania Railroad system is aiding more intensive farming and encouraging farmers to work together for the betterment of the farming industry in states through which its lines run. One of the first works undertaken by an association, formation of which was induced by the railroad, is cow testing. An expert from the Pennsylvania State College has been secured to aid in the formation of associations and in the testing of cows belonging to members. He will visit each herd once each month and assist in the weighing of the milk and make tests, keeping a tabulated report and generally advising the farmers. This service is to cost the farmers but a few cents each month.

NATIONAL DAIRY SHOW

The National Dairy Show to be held at Chicago October 26 to November 4 promises to be greater than any of its predecessors. The premiums offered originally have been increased in some cases 20 per cent and some new classes have been added. A model dairy barn is to be one of the features on exhibition and a set of elaborate photographs made by direction of the Bureau of Animal Industry on trips through leading dairy districts of the world will show agricultural architecture and appliances in a most instructive way. In dairy matters this is doubtless the greatest show of the world.

INSECTICIDE RULING.

Under the recently enacted law requiring purity of all chemicals used in insect control, decision number one has been rendered, and it has to do entirely with insect powder. It first specifies what shall be considered insect powder, and while hellebore and tobacco and many other powders may be called insect powders, it was determined that the words should apply to powdered flowers of certain species of chrysanthemum. This is one of the simplest of insecticides, the least offensive to humans, and when fresh we believe the most effective against household insect pests. The ruling is that pyrethrum, or insect powder, shall not be adulterated even with the stems of the plant from which it is made, or, if stems are used in any proportion whatever, a qualifying word or phrase must be used to express that clearly to the purchaser.

PARCELS POST

In a few remarks made by the Hon. Jonathan Bourne in the U. S. Senate last June, he shows to a certainty that Americans are a long suffering people. The bill which he introduced simply called for giving to Americans a postal rate in their own country no higher than we charge to foreigners for mail transmitted partly within the United States. He stated: "A Japanese residing in New York can send an 11-pound package to his friends in Tokio at 12 cents, but an American in New York can send only a 4-pound package from New York to Washington and must pay 16 cents a pound."

This was only one of the instances cited, and yet Americans swell up with pride when they think of their great advantages over the Japanese and other foreigners, while they continually grant to these same foreigners privileges which they do not take for themselves. It is time for a change.

WHEAT IN U. S. AND CANADA.

During 1910 the United States produced 695,433,000 bushels of wheat and exported 91,883,000 bushels. In the same period Canada produced 149,990,000 bushels, exporting 56,554,000.

Going back some thirty years, we note that the United States produced only 383,000,000 bushels, exporting 121,000,000, or materially in excess of last year's export. The greatest year, so far as the United States was concerned, was 1901, when 234,000,000 bushels were exported. It may be noted that our production has increased materially since 1881, but since 1891 there has been little increase in exports. In 1901 the production was much greater than in 1910, but the most striking feature of the statistics is the decrease in exports. Plainly we are eating more bread.

Canada's increase has been notable. In 1881 she produced only 32,000,000 bushels and exported 4,000,000, since which time her increase in production and export has been steady.

CLEAN UP.

This is the favorable time for agitating the question of improvement organizations and other movements for the uplifting and beautifying of our state. The eyes of the world will be turned upon us during the next four or five years, and impressions of our character will be formed by a vast throng who will visit the state during the expositions to be held in 1915. The tendency seems to be to center the whole energy in a comparatively limited space in the city of San Francisco and in San Diego. These cities will entertain the greater number of visitors, but the expositions will not be the only educators California can offer—the entire state should exhibit its best self. This is true as to the visitors who come every year to California—the difference in 1910 is only in degree. Let us all practice beautifying and bettering until it shall become a habit, so that the people of the world will return to their homes with favorable impressions of our homes and surroundings as well as our expositions.

COUNTRY LIFE CONFERENCE

At its first annual conference last year at Davis the California Country Life Committee was created and that committee has busied itself for the last few weeks with arranging a program for a rural education conference to be held at the University Farm at Davis October 14th. The work of the committee is to further the development of country life and the more imporant object of this coming conference is to discuss the needs of rural schools. Doubtless resolutions or recommendations will be made looking toward a "redirection of this important branch of the public school system." It is urged that delegates be sent from all portions of the state. Those entitled to go as representatives are: The Governor, president of the University of California and president of Stanford University, president of each of the state Normal schools, head of department of education at University of California and Stanford University, state superintendent of public instruction and each county and city superintendent of schools; delegates to be appointed or elected, each with alternate: Five at large by the Governor, one by each subordinate and Pomona Grange, one by each local and county Farmers Union, one by each Chamber of Commerce, Board of Trade, or Improvement Club, one by the Commonwealth Club of California, one by each of the six districts of California Federation of Women's Clubs, one by each Agricultural High school, one by each state Normal school, one by council of education of California Teachers Association; a rural schoolteacher, and a rural school trustee to represent the County Trustee Institutes, by each county superintendent of schools. Further information may be had by addressing Prof. Leroy Anderson, Berkeley, Cal.

Agricultural News Notes of the Pacific Coast

Northern California

The big winery at Vina, Tehama County, started on September 11.

A Butte County paper asserts that a small black ant is busy eradicating "water scale."

The Butte County board of supervisors has made an appropriation of $300 for the purchase of fumigating tents.

Citrus growers at Oroville are complaining because of the indefiniteness of food expert Wiley's ruling on green oranges.

A tract of 3,500 acres near Auburn, Placer County, has been purchased and will be subdivided and disposed of in small tracts.

A poultryman at Ukiah, Mendocino County, exasperated at continuous thieving, offers a reward of $50 for detection of the thieves.

Between 700 and 800 men are employed in the fields of the Sacramento Sugar Company. Both day and night shifts are being worked.

Counties of the eastern side of the Sacramento Valley are uniting in an effort to secure a just proportion of the $18,000,000 road fund.

The alfalfa meal mill at Woodland, Yolo County, has proved a money maker. It is now turning out about twenty tons of meal daily.

Durham, Butte County, is boasting over its largest yield of almonds and the growers will reap rich rewards, some claiming as high as $165 per acre.

Several valuable wells have been developed near Germantown, Glenn County. On one ranch sufficient water has been developed to irrigate 200 acres.

Farmers of District Ten, Yuba County, are petitioning the board of supervisors for a drainage ditch, the water to be drained into the Feather River.

An expert from the Division of Entomology is soon to arrive in Chico from Washington to investigate butterfly pest, which has made inroads on the alfalfa fields.

Luther Burbank has produced two new cherries which he has named Late Napoleon and South Giant. The trees are pronounced enormous and never failing bearers.

The Anti-Mosquito League at Oroville has secured the services of an expert from the Hawaiian Islands to take charge of eradication of the pest in that section of Butte County.

After finding some of his stock in pasture with broken legs from bullets of careless hunters, a Ferndale stock grower has declared war and is making a ceaseless hunt for the hunters.

The Henry Frasier hop ranch, near Nord, Butte County, will yield this year approximately a quarter of a million dollars worth of hops. An army of pickers is busy gathering the crop, and individual pickers are earning as high as four dollars a day.

Butte County board of supervisors has been asked to place a bounty on the heads of jackrabbits. Great damage is being done to young orchards and to vineyards. Request is also made that coyotes be placed on the bounty list with five dollars on each scalp.

Central California

Kerman, Fresno County, boasts a one pound Alberta peach.

Kern County claims 20 per cent more sheep than a year ago.

Holdover raisins still going forward are bringing excellent prices.

So far as can be determined raisins are drying very light this year.

A new peach cutter and pitter is being tested out at the Selma dry yards.

San Joaquin County held its annual agricultural fair last week at Stockton.

Large numbers of Greeks are arriving at Fresno to assist in the grape harvest.

Fresno County Fair Association is providing for a wild west feature at the coming exhibit.

Something over 800 wild turkeys will be released in the mountains east of the San Joaquin Valley.

Kings County poultrymen are doing some vigorous kicking over poultry awards at the recent state fair.

A dairyman of Waukena, Tulare County, was fined $30 last week for unsanitary condition of his dairy.

The first annual picnic of members of the Pajaro Valley Poultry Association was held at Port Watsonville last week.

Peach buyers report a shortage of the dried product to the extent that many buyers have sold short and will be unable to deliver.

Governor Johnson has called for a cleanup day and it is expected the entire state will devote the day to tidying up roadsides.

Articles of incorporation of the Great Western Vineyards Company have been filed with the secretary of state. The capital stock is $5,000,000.

A green house at Menlo Park, San Mateo County, contains what is claimed to be the most valuable orchid in the world. One plant is valued at $10,000.

Grape growers are pushing the picking of raisin grapes as rapidly as possible to get them out of the way of early rains.

A gardener from the Royal Agricultural Academy and Horticultural School of Sweden recently visited Watsonville to investigate as to apple by-products.

Some raisin packers have made fierce onslaughts on the raisin market in hopes of bearing so that they can stock up at a low price, but most growers are holding firm.

A Tulare County peach grower gathered from 110 four year old peach trees over 8,000 pounds of peaches, with scarcely a cull in the whole lot. He sold for the uniform price of three cents per pound.

Tulare County has been appealing for federal aid in the control of the squirrel pest of that county. It now has assurance of government action as to the land located within the boundaries of the forest reserves.

To test the value of a motor car in transporting fruit, a Visalia grape grower took a load of table grapes from Globe, twelve miles east of Porterville, and made a 315 mile trip to San Francisco, and arrived with the grapes in good condition. The load was made up of 7,240 pounds of grapes.

Southern California

Pomona Valley is holding its fair this week at Pomona.

Between forty and fifty cars of Valencia oranges are going East daily.

Bean threshing is in full swing in the section of Camarillo, Ventura County.

The Upland Citrus Association held its annual meeting and picnic dinner at the packing house last Saturday.

Ten cars of early grapes shipped during the middle of July from Brawley netted an average of $1990 per car.

The Pomona Valley has forwarded this year 4,682 cars of oranges. The receipts in that one valley will be nearly $3,500,000.

Several Southern California counties are combining to install an exhibit at the 1915 Panama-California Fair at San Diego.

A fake story regarding the Colorado finding its way through an underground channel to the Salton Sea has ended in exposure.

The largest irrigation project in San Diego contemplates a dam which will impound waters for the Santa Maria and San Pasqual sections.

New artesian wells are being sunk in the Antelope Valley, Los Angeles County, some of which are producing a flow of thirty miner's inches.

Seventeen pumping plants are supplying abundance of water to lands in Apple Valley, San Bernardino County. These lands are near Victorville.

The first car of 1911 cotton left El Centro Wednesday morning, September 6th. It was billed to Bremen, Germany, and was made up of 50 bales.

A tract of land between Elsinore and Wildomar, Riverside County, has secured an excellent water supply. The lands are adapted to citrus culture.

A French inventor is visiting the beet fields of Southern California. He claims he has invented a beet harvesting machine which will do the work of 100 laborers.

The board of supervisors of San Bernardino County is contemplating material improvement of the road to Big Bear Valley. The Santa Ana Canyon route will be chosen.

Beet growers of Orange County are forming a co-operative organization looking toward securing higher prices for next season's crop. It is hoped there will be about 40,000 acres in the new organization.

At the recent annual meeting of the San Dimas Orange Growers Association remarkable growth of the exchange movement was shown. A new packing house has been constructed within the past year, costing $55,000. The shipments during the year aggregated 627 cars, for which the growers received over $337,000.

The Ontario Citrus Association shipped during the last year 297,603 boxes or 775 cars of oranges. The average expense for material and packing was 28.4 cents. Directors for the coming year are: G. W. Russel, president; H. E. Swan, vice president; Hugh Latimer, J. T. Lindley, B. E. Williams, A. T. Hamilton and J. A. Clark, and Charles B. Ford, secretary and manager.

The Coast

Oregon's estimated hop crop is 80,000 bales.

Wheat at Elgin, Oregon, is running 45 bushels to the acre.

Portland, Oregon, is suffering from a visitation of stink bugs.

The fruit crop of the Coeur d' Alene section of Idaho will be exceptionally large.

The heaviest wheat sales of the season were last week at Walla Walla, Washington.

Fifteen steam threshers have completed their season's work at Garfield, Washington.

Onion growers at Woodburn, Oregon, are claiming $60 per ton or nearly $500 per acre.

The principal dish at the recent statehood celebration at Yuma was ostrich egg omelet.

Swarms of locusts have caused a famine in the Sarangani region, Island of Mindanao, P. I.

Cleared stump lands near Moscow, Idaho, grew oats this year five feet and ten inches high.

Forest Grove, Oregon, boasts of more green lawns than any other town on the Pacific Coast.

One alfalfa seed producer at Yuma recently shipped 60,000 pounds of alfalfa seed to Los Angeles.

Alfalfa growers near Amity, Oregon, are hulling allsike clover and will receive big returns for seed.

British Columbia imported from the United States during 1910 $491,000 worth of fruit and vegetables.

Five cars of Jonathan apples were shipped from Toppenish, Washington, to Australia on the first of the month.

It is said that over 300,000 acres of land are being developed by irrigation in the state of Oregon at the present time.

Much profit is being made on cascara bark in the Trout Lake region, Washington. It goes to the Portland market.

Clover growers at Amity, Oregon, are selling their clover seed at $9.00 per bushel. The average is about five bushels per acre.

The chief horticulturist of the Lewiston Land and Water Company is planning a horticultural survey of the Clarkston fruit growing districts.

A 500 foot well at Las Vegas, Nevada, is flowing twenty inches of water and giving promise of adding wealth to many acres of valuable land.

Crop conditions near Winnipeg, Manitoba, are fair, wheat running eighteen to twenty bushels. The first carload shipped was about the first of September.

Secretary Fisher of the Department of the Interior has been requsted to supply at least $4,000,000 from the reclamation fund for the Umatilla project in Oregon.

Severe frosts at Winnipeg, Canada, have done great damage to all standing crops. In fact, all crops of the Saskatchewan and Northern Alberta section were injured.

The report that the Colorado River has buried itself in an underground channel two miles below Yuma afforded neswpaper reporters opportunity for many "reasons" for the conduct of that river.

Questions and Answers

THE EDITOR AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Strawberry Planting.

When is the best time to plant strawberries so as to assure crop next spring? What is the best variety? Are old plants replanted or are new plants best?—Subscriber, Colton.

Unless you can set potted plants I know of no method whereby you can get a full crop next season. But if you get good plants and set them about February 1st you will get a partial crop of very fine berries next spring. They will commence bearing in May and continue to bear until about July 1. Such plants if well cared for during the remainder of the season would be in shape to produce a fine crop the following year. The Brandywine is the best variety. The Klondyke is also a good berry and earlier than the Brandywine. Never use old plants but get thrifty, well-rooted runners. I never use runners that are from bearing beds as they will be weak and yield poor crops. Plant growing and fruit growing with the strawberry are—or should be—entirely separate operations. It will pay you to plow under plenty of stable manure in your strawberry ground before planting; as you cannot fertilize in any satisfactory way after they are set out. Plant in rows on level, 20 inches wide and set the plants 10 to 12 inches in the row.—Q. A. L.

Planting Peaches.

Is the fall a good time to set peach trees and grape vines?—Subscriber, Glendora.

The months usually termed fall or autumn by the calendar are too early for planting in California. Deciduous trees must be dormant and this does not occur sometimes until December, but once they are perfectly dormant they may be planted and any time from December to March will answer.

Sowing Lawn.

When is the best time to sow lawn, fall or spring. How should ground be prepared? Is there any danger of getting Bermuda grass seed with seed for lawn?—Subscriber, Glendora.

Lawn may be planted almost any month of the year in California if one uses due care and judgment as to handling according to the season. At this time of the year great care must be used to keep thoroughly wet. Fall planting gives one advantage in this that a fair start may be secured over the Bermuda. Spring planting is perhaps rather easier, but Bermuda and other weeds seem to be in their prime also at the same time and more weeding is necessary. If no work whatever has been done upon the ground the first step will be thorough irrigating which will wet down a foot or two deep. If stable manure is to be used it should be spaded in at this time followed by another thorough irrigation and a few days rest given to permit seeds to sprout. Hoeing or cultivation should follow with another irrigation. This may be kept up for a month or two and will help in reducing the number of weeds which will come after sowing the grass seed, and in addition will firm the ground which was deeply spaded and also rot the manure which was spaded in. During this hoeing continual care must be given to general leveling or surfacing up of the ground. When the weeds have been well started and destroyed by hoeing, the ground may be brought to finer tilth by continual hoeing and raking to make a perfect seedbed. Of course attention has been given before this to making a general even surface. If thoroughly tramped rolling may not be necessary, but going over it with a heavy roller is to be preferred if one is at hand.

After this preliminary work has fitted the surface a thorough application of bone meal is desirable. We have seen this applied at the rate of a large bucketful to the square rod and with excellent results. With a fine garden rake make the seedbed perfect, then on a damp and still morning sow the grass seed. According to preference this may be blue grass or mixed lawn grasses, but the writer prefers blue grass and white clover mixed in the proportion of four parts of blue grass to one of white clover. Apply seeds at the rate of one pound per 200 square feet.

If clean, well-rotted manure which has afterwards been dried and pulverized can be had, the application of this material screened and sowed nearly half an inch thick, is very desirable, but if this is not thoroughly rolled the danger of growing millions of weed seeds would overcome the advantages. After the seeding start wetting one to three times daily according to weather. Use only the very finest of sprays and be sure the ground is not allowed to dry or crust. On slopes the use of weeds or even barley sacks over the surface prevents washing of the soil. There is practically no danger of securing Bermuda grass with your lawn seed, but notwithstanding that it will come in your lawn thick enough to make you think it must have come with the seed. Continual work with the lawn seems to be the only way to secure immunity from this pest.

Oleander Poisonous.

Is it true that oleander leaves and blossoms are poisonous? If so, to what extent?—Subscriber, Turlock.

That oleander leaves are poisonous has been proven by experiments conducted by the Arizona Experiment Station, results of which are published in Bulletin 59 of that Station. The dried leaves were fed to stock with disastrous and even fatal results. The danger from this shrub may be shown by the fact that the Arizona bulletin speaks of five soldiers being seriously poisoned through use of an oleander branch in stirring barley soup. Another serious case of poisoning is mentioned in which over 300 French soldiers were poisoned by eating roast meat which had been skewered with oleander sticks. In one of the experiments a horse was fed 25 grams of green oleander leaves, a little less than an ounce. It must be stated, however, that the animal would not touch these, having been formerly poisoned by an offering of a similar dose in mash, so to test the matter, they were given to her in capsules. Two days later the animal was in low spirits and the third day dead. Apparently unless driven to it the animals will not touch leaves, so we assume that ordinarily there will be but little danger. but if they do eat, almost sure death follows.

Fly Repellent.

In our issue of July 20th we made reference to a fly repellent made from resin, soap and fish-oil. A subscriber, Mr. A. L. Reimers of Dinuba writes: "We made this formula, following instructions exactly, and find the mixture entirely worthless. We have tried and tried and find it attracts rather than repels the flies. We depend upon your paper for authoritative information and feel that you should know of this."

We appreciate Mr. Reimer's information.

Budding Young Peach Trees.

I have a young Muir peach orchard, two years old last spring, planted in a high, dry, sandy loam, very hard soil to get the trees started in, but the best kind of peach land when once started. Now in this orchard about a

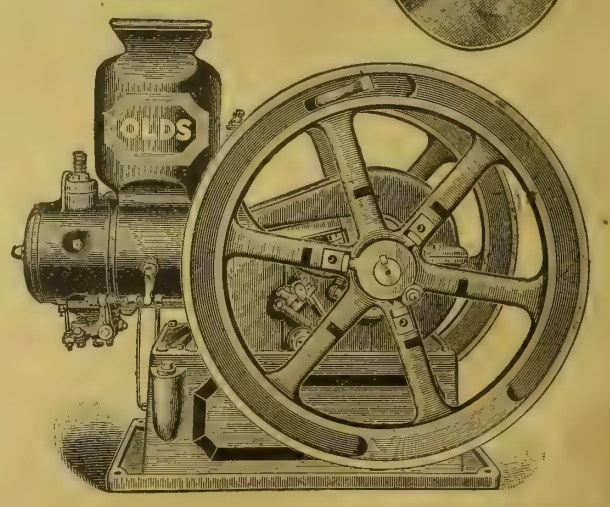
FREE this real leather bill fold for the Head of the Farm

(Not for boys—they're all right and their turn will come later—but this is for the boss.)

Thousands of farmers will buy gasoline engines this Fall and Winter. I want to get in direct and personal touch with every one of them, as I want them to know about the Olds Engine.

If you are going to buy an engine, or are thinking about it, you ought to know what an Olds Engine will do for you. I want to tell you about them—give you just the information you want—so if you will fill out the coupon below (or write me a letter) saying what size engine you want, whether portable or stationary, and when you expect to need one, without asking you to make any promise or obligating you in any way, *I will send you absolutely free* this genuine calfskin bill fold, stamped with your name in gold letters.

It will hold fifteen bills easily. When folded it will go in a small pocket. It is very convenient, handsome and useful; will last a lifetime. Has no advertisement on it.



OLDS GASOLINE ENGINES

are known the world over and used by farmers everywhere. They are the most satisfactory engine made for farm work. I guarantee them to do all we say they will—you to be the judge. Ask any man who has an Olds Engine. He will tell you.

We also make complete electric light and water systems especially for farms.

Write for our prices on corn shellers, corn huskers, feed grinders and cream separators.

If you are going to buy an engine, put a check mark (X) in the place showing the size and style engine you want, and when you expect to need it, and mail to me personally at once. Address me as below.

third of the trees proved to be seedlings. What I want to know is owing to the trees being well-rooted now, would it not pay me better to bud the trees to budded fruit, rather than transplant or replant to budded trees? Couldn't I by budding, say three or four smaller limbs on each tree, and keeping all seedling wood back, make sure?—Subscriber, Calpella.

Unless you have had experience we fear you may have trouble getting a good stand of buds. The budding or grafting of stone fruit trees in orchard is not one of the easiest tasks. and yet if successful, as you say, you would be ahead with your established root systems. We believe we would prefer starting new trees from nursery if good thrifty trees could be had, giving a little extra attention to establish them the first year. If budding of the orchard trees is attempted, would advise spring budding. It is probably too late to catch flow of sap this fall on trees which have not been irrigated. In the spring when the sap is nicely started the attempt might be made with a few trees to test it out.

Age of Billy Goat.

Will our billy goat seven months old answer for breeding purposes and how late in the fall may goats be bred? Is it advisable to allow males and females in same pen?—M. & M., Farmington.

This query was referred to Mr. Winthrop Howland, owner of one of the largest goat dairies in this country and thoroughly qualified to answer questions, and he says:

"Would not advise use of buck under ten months of age, and twelve months is better. Does may be bred as late as January 1st, with good promise of 'taking.' If buck and doe are kept together in same stable they should be in separate stalls, as buck will otherwise annoy doe. We put buck with does only for a few minutes when breeding."

Discharge from Pipe.

I expect to build a reservoir this fall. It will be 1000 or more feet away. Will two-inch pipe be large enough to irrigate one or two acres of garden; light, gravelly soil?—Subscriber, Santa Maria.

The subscriber leaves out information necessary to an intelligent answer. The distance, 1000 feet. is of course one of the factors which must be known to determine the discharge, but the more important one is the fall from the reservoir to the land to be irrigated. If it is almost on a level the two-inch pipe will not be sufficient. If the fall is very great it might supply sufficient for several acres.

Warts on Teats.

Please give remedy for warts on cow's teats.—Subscriber, Tulare.

Apply warm water until all loose and dandruffy skin is removed. Then put on cold pressed castor oil every day for a week. This will usually remove warts on the teats and udder without any further trouble. A very stubborn one can be removed by the use of butter of antimony. This is a poison and is applied with the end of a feather directly on the center of the wart. Wash it off before milking the next time. Tie the cow up in a stall so she will not lick it off.—M. E. S.

Kerry Cows.

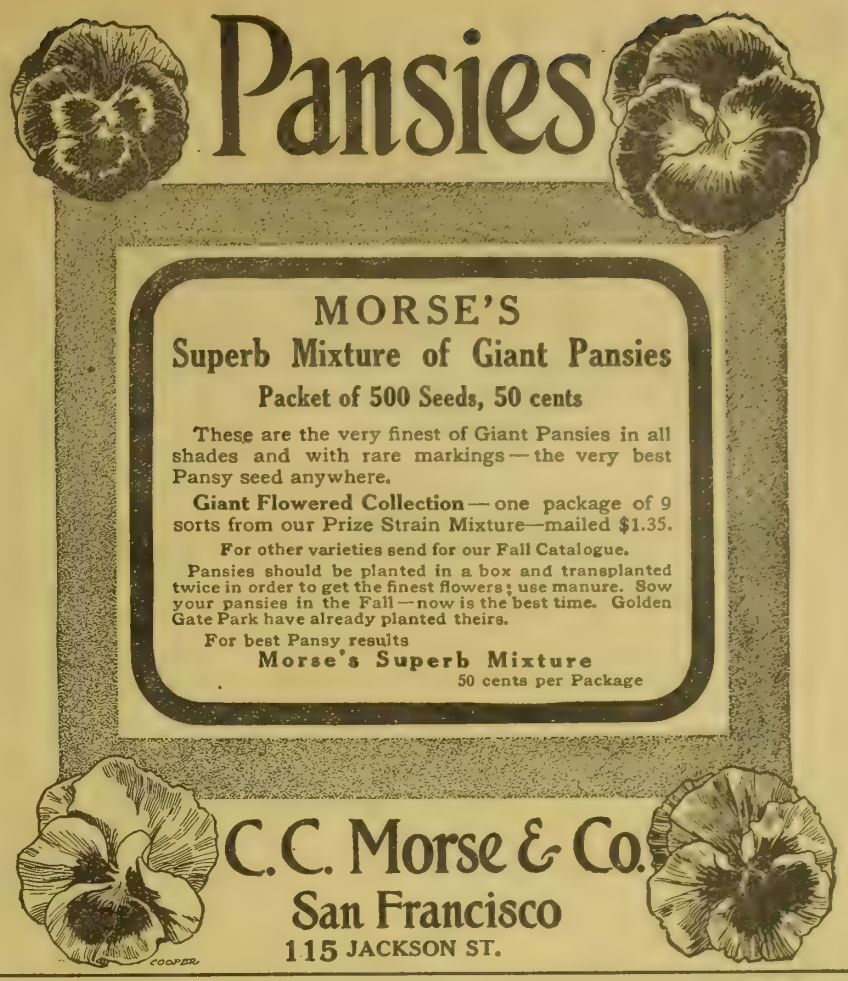
Please give information as to Irish breed of cattle called Kerry.—Subscriber, Irvington.

The Kerry and Dexter cows are liked in Ireland, but I hardly think it would pay you to send for them, as we have other breeds right at hand that are as good in the dairy. These black animals are often quite small, the cows weighing about 550 pounds and the bulls about 800. One of the celebrated prize winning bulls weighed only 400, while in the same show a competitor weighed 1000. The small size has been brought about by the scanty feeding and they are very hardy animals. Record books are kept under the name of the American Dexter and Kerry Cattle Club, Columbus, Ohio.—M. E. S.

Sensitive Teats.

What can be done for cow that has such sensitive teats that she will not stand during milking?—J. I. D., Lemon Grove.

Use a milking tube well sterilized and after taking it out, put into each of the teats that are hard to milk a lead plug to distend them, sterilize the plug by boiling. In sterilizing these tubes and plugs if a piece of thread is tied to them to handle them by and the portion that goes into the teat never handled, the danger of infecting the udder is overcome. Bathe the outside of the udder with boracic or boric acid water. Buy ten cents'



Pansies
MORSE'S
Superb Mixture of Giant Pansies
Packet of 500 Seeds, 50 cents
These are the very finest of Giant Pansies in all shades and with rare markings — the very best Pansy seed anywhere.
Giant Flowered Collection — one package of 9 sorts from our Prize Strain Mixture—mailed $1.35.
For other varieties send for our Fall Catalogue.
Pansies should be planted in a box and transplanted twice in order to get the finest flowers; use manure. Sow your pansies in the Fall — now is the best time. Golden Gate Park have already planted theirs.

worth of the crystals and put them into an eight-ounce bottle of hot water. They will dissolve only a 4 per cent solution, leaving the rest in the bottle to have more water added until all is used up. This solution should be used to bathe the outside of the udder twice a day.—M. E. S.

Possibly Work of Gophers.

I send trunk of young orange tree which has been affected with gum disease or some trouble removing all the bark from the surface of the ground to the roots and even on some of the roots.—Subscriber, Escondido.

There was nothing on the trunk of the young tree to indicate gum disease, neither were there any marks of the teeth of gophers, but it looked as if gophers, moles or some small pests had caused the trouble. If gum disease caused it then irrigation must have removed all effects of the gum, as it is soluble in water and flooding around the tree will cause it to disappear. If the trouble is caused by four-footed pests the remedy is obvious; if by gum disease the heavy soil should be removed from the roots, filling in with sand or sandy loam and treating the trunk with neat's foot oil. If the rest of the trees are so seriously affected and have been allowed to rest several months since the injury, the only thing which will save the trees is bridge grafting.

Nightshade Plants.

I send weed infesting our pastures. What is it?—Subscriber, Wendell, Idaho.

This plant was submitted to a botanist and declared to be solanum nigrum or black nightshade. It is an annual and said to be entirely harmless. Children have eaten the berries and enjoyed them and they are often used for pies and preserves.

Tuberculosis.

Please give information as to tuberculin test. Is tuberculin furnished by the state? Can tuberculosis be detected in milk? Is it a fact that the human family can contract the disease from use of milk from tuberculous cows?—Subscriber, Tulare.

The University of California offered to furnish the tuberculin and an instructor to train a class or a group of dairymen in any community on its practical use. These men were in turn to help others test their herds. Address Dr. Haring, College of Agriculture, University of California, Berkeley, for information as to what they are at present offering to do for the dairyman along this line. I consider the test important and I believe, entirely aside from the matter of health, that a dairyman cannot afford to have this disease taking his cows from him in their prime. The financial loss he would regard as very serious if it came in a night like anthrax. Yet it is a very steady drain on his pocketbook. The tuberculin test is reasonably certain if the people using it are observant of the condition of the cow, before injecting. It will not do to take the temperature of the cow once, then inject and take her temperature once after eight hours and pass her as not reacting. The temperature of the cow must be taken often enough and when she is free from any other physical emotions, to find out the normal degree of her body. Cows that feed on the same hay or drink from the same troughs transmit the disease one to the other. While it might be possible to pass it through a wire fence I hardly think it probable. It may at times be detected in milk but usually when there is a lesion in the udder the cow owner detects it and rejects the milk. It will not do to take the position that the dairyman is wilfully selling diseased milk, for he is not any less of a man than other men, and few would sell anything diseased. The usual way the bacilli of tuberculosis get into milk is by manure particles falling into the milk. The manure carries the bacilli often in great numbers. The government reports obtained from Washington are probably the best source of information on the matter of bovine tuberculosis. The human disease is not quite the same but human beings die from the bovine form. The statistics have not been kept very long and are therefore not conclusive in this respect. In children it is said that two per cent are directly traceable to milk. These are the cases where the bowels are the seat of the disease.—M. E. S.

Butter Won't Come.

Cow has been fresh two weeks. We are unable to get butter from the cream. She is fed alfalfa and is apparently perfectly healthy. We have had no trouble along this line with her milk before. After churning two hours the cream is greasy.—Subscriber, San Fernando.

Try ripening the cream more thoroughly before churning. The night before churning put the cream can into a tub of hot water and stir it until the whole mass reaches 85 degrees. Then cover it for a couple of hours with a heavy blanket to retain the heat. Cool down by standing it at the temperature that it is usually kept. Now this warming has to be tried probably once before the exact time it should be held at the higher temperature can be determined. When the cream is ripe for churning it has an acid taste, and when it is dropped in single drops from a spoon held a couple of feet above the vat, it falls on the smooth mass of cream, making for an instant a little pit on the surface. There is only one case on record of a cow whose milk would not churn when the cream was ripened, so I think you will find that this will correct the difficulty.—M. E. S.

Garget.

Cow which freshened in February is troubled with one of her hind teats, milk will not flow, quarter is swollen a trifle though apparently not sore, and there are small, hard lumps in it. Have kneaded and bathed udder with warm water.—Subscriber, Clovis.

This heifer has garget and these cases are sometimes helped by using a milk tube in the weak teat. These cases run their course and often cure themselves when the cow comes in fresh again. When the milk tube is used be sure it is boiled between insertions. Then after using it put into the teat and leave it there until next milking time, a lead plug. The bathing with warm water is right treatment and rubbing the affected quarter with spirits of camphor will assist in drying up that portion of the udder until she freshens again.—M. E. S.

Dried Off Too Early.

I have a cow which I have not dried off on account of making a mistake in time when she will freshen. Four or five days ago I started to dry her off, but find I cannot do so. How should she be handled now? Should I milk her regularly right up to freshening time?

Continue to milk this cow and give her more feed if she is thin. To attempt to dry her now would be to invite trouble with garget. It does not hurt a cow to be a continuous milker if she is given enough to eat. I have had cows that were never dry for nine and ten years. It is impossible to force a cow that is milking four gallons a day dry without destroying her future usefulness, and this class of cows are becoming more and more common.—M. E. S.

Growing Alfalfa.

Our soil is a deep, rich sandy loam with no hardpan. There was no legume crop before we seeded to alfalfa last January; the land had been used for several years only for one crop of winter hay, barley, I think, which was cut, the stubble being turned under in time for next planting. Would you advise using lime or land plaster? If so, about how much per acre and when spread? Also what do you think of a light planting of barley or oats for an additional winter crop? Do you think it wise to disk the alfalfa in the spring? I understand that many fields are kept in good condition for long periods of time by thoroughly tearing up the roots about every three years or so with a drag or harrow. As to fertilizers, do you consider potash and phosphate good? And if so, about what quantity and when, for best results? What about the alfalfa weevil?

Our knowledge of agriculture, like medicine, is built up at first empirically or on the usages that have given results. Then science takes these results and finds out why, and has the

lata to build up into improved ways of helping us out in saving money.

Land plaster helps us out greatly n the San Joaquin Valley and I see lo reason why it should not help your and. It is applied in the fall usually s a matter of convenience, as then he teams are idle. You can try it his fall by measuring off a piece of and two hundred feet by two hundred nd applying five sacks of the gypsum roadcast to it. The rate of using gypsum is about four hundred pounds o the acre. While more does no harm it does not seem to increase the ield greatly. Disking alfalfa is not lone to tear it up but to increase the number of plants to the acre. The lisks are set straight so as not to tear t out, but to split the heads. They re split one way first time. Then he next year these are again split the other direction, so I have taken up alfalfa roots on land that was constantly disked to find as many as eight heads leading down to one central oot. The time for disking is when he ground is wet enough to allow he roots to slip and not to be torn out but sliced readily. I hardly hink you will need potash or nitrogen or other fertilizers at present on alfalfa. State Horticultural Commissioner Jeffrey has placed restrictions on the importation of alfalfa seed from nfected districts. Any pest that starts s at first at its worst and then gradually the plants that are left develop esistance, so in the end the loss is ess than the first ravages would indicate.—M. E. S.

School for Feeble Minded Children.

Is there a state school in California or feeble-minded children? If so, where, and whom can I address for full particulars? Are there any private schools of that kind?—Subscriber, Lemoore.

The Sonoma State Home, formerly known as the California Home for the Care and Training of Feeble-Minded Children, is located at Eldridge, California. The president is C. E. Haven of Santa Rosa, but we suppose the proper person to address for information is Dr. Wm. J. G. Dawson, Medical Superintendent, Eldridge, Cal. We cannot inform you as to any private schools of this nature.

Borer.

What will destroy borers in fruit trees? Do they attack all kinds?—Subscriber, Granite Station.

The best way to destroy the borers is by the use of slender wire inserted into the opening, but the best remedy for borers is never to have them, in other words, use preventive measures. While infesting many varieties of trees, they are scarcely ever found excepting where there has been sunburn or other injury of the bark of the tree. Keep the bark from scalding and in good healthy condition. After severe pruning whitewash the trunks and larger limbs, or even protect with sacks or paper. A mixture of whale oil soap in the whitewash proves beneficial.

Swelled Head.

Please answer in your columns. Some turkeys have swelled head. I have seen one that was nearly blind from swelling. What's the cause. How may it be prevented?—Subscriber.

You will find full answer to this on page 209 Cultivator of August 31. The complaint is roup. The cause is either from taking cold or from lice and from contagion. The cure has been fully given. You may have to lance the swelling if very hard.—Mrs. A. B.

Split Oranges.

A number of my half-grown oranges are splitting at the navel end. What is the cause? Is once or twice a week too much to water orange trees? Also have an orange tree six years old which has never borne. What is the cause?—Subscriber, Granite Station.

There are many theories as to the cause of oranges splitting. Probably the most common and most generally accepted is irregularity of irrigating. However, we have heard this answer given in conventions and institutes when dozens have bobbed up to declare that with absolutely regular irrigation they still have split, but we be-

MISCELLANEOUS

60 H. P. 4-CYLINDER AUTOMOBILE. Engines guaranteed mechanically perfect. Wheel base 120", tires 4½x36". Was bought in spring of 1909; cost $4000. Has first paint and good tires, good transmission, gears first-class. This is a roadster made for heavy roads. Would make fine desert car or truck. Was taken in real estate deal. Positively no use for it. Will take $675, or would trade for hay, horses, farm machinery. What have you? On account of trip to Europe, I am leaving this car with Demmitt Windmill Co., Los Angeles, who will close any deal in my behalf.

Free—"Investing for Profit" Magazine. Send me your name and I will mail you this magazine absolutely free. Before you invest a dollar anywhere, get this magazine—it is worth $10 a copy to any man who intends to invest $5 or more per month. Tells how $1,000 can grow to $22,000; how to judge different classes of investments; the real power of your money. This magazine for six months free if you write today. H. L. Barber, Publisher, R. 430, 28 W. Jackson Boulevard, Chicago, Ill.

PESTS.

Some folks there are
I'd like to swat
And shed their gore
Upon the spot.

The worst is he
Who wakes at dawn
And hastens forth
To mow his lawn.
—Milwaukee Sentinel.

Some folks there are
I'd like to kill,
And some sweet day
By heck, I will!
The fiend whose brain
I'd toss like chaff,
Is he who runs
That phonograph.
—Los Angeles Express.

A POSER.

Johnny—Grandpa, do lions go to heaven?

Grandpa—No, Johnny.

Johnny—Well, do you ministers?

Grandpa—Why, of course. Why do you ask?

Johnny—Well, suppose a lion eats a minister.—Life.

NO DIFFICULTY.

"I shall not marry," said a conceited young man, "until I find a woman exactly opposite to myself." "Well," replied his sister, "you know plenty of amiable, intelligent girls."

POSTAGE STAMP MUCILAGE.

The mixture used on the United States postage stamps is stated to be as follows: Two parts of dextrin are dissolved in one part of acetic acid and five parts of water on a water bath, and after solution, one part of alcohol is added.

Flubdub—Well, I suppose you were up bright and early this morning?

Roundabout—No, sir. I am never up bright and early. If I am up early I am not bright, and if I am up bright I am not early.—Puck.

Milk Coolers, all sizes and prices Guy F. Kelsey & Co., 106 East Eighth St., Los Angeles, Cal.

lieve that if the irrigation is very thorough and the water is carried to the lower depths and the irrigation fairly regular, the percentage of split fruit will be low. As to the six-year-old tree not bearing, we would suggest rather deeper irrigation than usual and surely not so frequent as mentioned by the inquirer. Once every thirty days or once every six weeks on most soils is sufficient, but one must consider his own soil conditions and water accordingly. Deepest cultivation, together with fertilization might bring this tree out. An additional safeguard is the application of from one to three pounds of nitrate of soda at blossoming time or slightly before.

Pears Not Bearing.

Have a pear tree six years old, heavy with bloom every spring, but has never yet borne any fruit. Tree is vigorous.—Subscriber, Granite Station.

This may be because the variety is not suitable to your locality. Again, it may be because the flowers are imperfect and require pollen from another tree blossoming at the same time. The only way this can be decided is to plant some other variety alongside.

Planting Strawberries.

What is the best season of the year for planting strawberries, raspberries, or other small fruits? If set at this time, will they have to be covered during the cold season?—Subscriber, Granite Station.

January is probably the best month for planting strawberries. December to the first of March is best for bush fruits. If the berries are to be planted in a section where, as the subscriber writes, an orange tree has grown to be six years old, no thought need be taken as to covering during the winter. The writer has planted strawberries in ground which had been crusted by severe frosts during the night, yet they made fine growth and gave a small crop the first season.

Evergreen Vines.

What vine can be used which is green all the winter and is hardy enough to stand frost?—J. B. E., Granite Station.

The English Ivy will probably be as acceptable as any and is perfectly hardy. The only objection to it is its slow growth.

Planting Walnuts and Pears.

I have land in the San Luis Rey Valley three miles from the ocean, with abundance of irrigating water. Soil sandy, water five or six feet from the surface. Will walnuts and pears do well on this land?—G. A. O., Oceanside.

These conditions seem almost ideal for walnuts and pears, if the case is stated correctly. The water level should be reasonably regular. If it stands at five or six feet the year round, all will be well, but if during the wet season it rises to within two or three feet of the surface and remains during a long period, it would not afford ideal conditions for tree growth, especially for walnuts.

Anonymous.

If "Subscriber," Laton, will send us his name and address, the information he asks will be mailed, as it has appeared in a recent Cultivator. We call attention to the last statement in the notice at the head of this department: "Unsigned communications receive no attention."

Legal

Edw. L. Payne, attorney, 301-304 Douglas Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Payne is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Farming Implements Exempt.

What personal farm property, tools, etc., also household goods, can a farmer hold from seizure for ordinary open accounts or court judgments relating to them? Can a wife hold personal property that was her own, for instance, a driving team?—J. K., Imperial.

The farming utensils or implements of husbandry of the judgment debtor, not exceeding in value the sum of one thousand dollars; also two oxen, two horses, or two mules and their harness; one cart or buggy and two wagons, and food for such oxen, horses or mules, for one month; also, all seed, grain, or vegetables actually provided, reserved or on hand for the purpose of planting or sowing at any time within the ensuing six months, not exceeding in value the sum of two hundred dollars, and seventy-five beehives; one horse and vehicle belonging to any person who is maimed or crippled, and the same is necessary in his business. Necessary household, table and kitchen furniture, including one sewing machine, stove, stove pipes and furniture, wearing apparel, beds, bedding and bedsteads, hanging pictures, oil paintings and drawings drawn or painted by any member of the family, provisions and fuel actually provided for family use, sufficient for three months, and three cows and their sucking calves, four hogs and their suckling pigs, and food for such cows and hogs for one month; also one piano, one shotgun and one rifle. No real estate is exempt unless it be homesteaded, or unless it is exempt under the United States laws for debts incurred prior to patent, or by some special provision of the state law. A wife can hold her separate property as against the creditors of the husband, where she has not joined in incurring the debt.—E. L. P.

Transferring Judgment.

Is judgment obtained in Wisconsin collectable in California? Is the process of transferring such judgment complicated?—B. D., Lindsay.

Suit can be brought on a foreign judgment in this state. The procedure is not complicated. If you intend to establish your judgment here, you should get a certified copy of the judgment from Wisconsin as a basis for your suit here.—E. L. P.

Rent for Meter.

The water company charged me $15 for meter. After buying and paying for this meter, can the city water company compel me to pay a flat rent of 75 cents per month for use of the meter on each monthly bill? Does the company own the meter after receiving full payment for same?—Subscriber, Eagle Rock.

If the $15 you paid was the purchase price of the meter, it belongs to you, and the company has no right to charge you rent for it, but the custom is for the $15 to be considered merely as a deposit for installing the meter, and not as payment for the meter.—E. L. P.

Distribution of Water.

We bought our water right with our land, and it goes only with the land for which the certificate calls. When the water was short the manager has ruled that the water goes only to those having alfalfa. Is this acording to law, or is he liable to a suit for damages by depriving others of their share? The water company is maintained by assessments, each paying the same according to acreage, no matter what is grown on it.—F. G., Greenfield.

The manager has no right to discriminate in favor of land in alfalfa, unless he is given that right by some provision in the by-laws, or in the charter, or by some document to which the stockholders have consented. If the manager is acting arbitrarily and without any authority, he is liable in damages. If he is acting under direction of the board of directors, and they in turn are acting without authority, they would be liable for damages. This is presuming that each stockholder, by virtue of the charter, or by-laws, or other agreement, is entitled to water in turn, or at stated periods, or to a certain quantity, upon demand.—E. L. P.

Are You an Expert?

If you are, every point that we claim for

Z-S Engines

will appeal to you as of vital importance, and you will realize that the man who designed an engine combining practically all the essential features and many unique improvements, and at the same time preserved the three essentials,

Simplicity Reliability Economy

knows what a gas engine should be. Paul F. Schryer convinced us, after we had been dealing in other gas engines for years, that from many standpoints he had produced the

Most Desirable Engine on the Market

Let us tell you what, as experts, appealed to us and caused us to add our guarantee to his of every Z-S Engine sold out here.
Write us today for Paul Schryer's book:

"How to Choose a Gas Engine."

A SONG OF THE PLOW.

From Egypt behind my oxen with their stately step and slow
Northward and East and West I went to the desert sand and the snow;
Down through the centuries one by one, turning the clod to the shower,
Till there's never a land beneath the sun but has blossomed behind my power.

I slid through the sodden ricefields with my grunting, hump-backed steers,
I turned the turf of the Tiber plain in Rome's Imperial years;
I was left in the half-drawn furrow when Coriolanus came
Giving his farm for the Forum's stir to save his nation's name.

Over the seas to the North I went; white cliffs and a seaboard blue;
And my path was glad in the English grass as my stout red Devons drew;
My path was glad in the English grass, for behind me rippled and curled
The corn that was life to the sailor men that sailed the ships of the world.

* * * * *

The sun of the Southland called me: I turned her the rich brown lines
Where her Parramatta peach trees grow and her green Mildura vines;
I drove her cattle before me, her dust, and her dying sheep,
I painted her rich plains golden and taught her to sow and reap.

From Egypt behind my oxen, with stately step and slow,
I have carried your weightiest burden, ye toilers that reap and sow!
I am the Ruler, the King, and I hold the world in fee;
Sword upon sword may ring, but the triumph shall rest with me!

—Country Gentleman.

BOYS MUST BE BOYS.

By Gertrude M. Neil.

Mrs. Rose was quite surprised to see the chubby face of Jack Ingram, a sturdy boy of ten, when she answered the knock at the side door.

He was a neighbor, living three doors away, and he did not often bother her, as she did not encourage intimacy between her own boy and this same Jack Ingram.

It was an attractive little face—round, rosy, and just a little bit dirty. The uncovered head looked as if it had not been combed since morning.

"Say, Mrs. Ross," he stammered, hesitatingly, as he twirled his little cap 'round and 'round on one hand, "would you mind tellin' a fella why you said what you did about me to Mrs. Brown when you passed over the bridge and I was catchin' pollywogs in the creek? You know you said, 'If that boy was mine he would break my heart!'"

Mrs. Ross' face grew very red, and she did not know what to answer. Seeing her confusion, Jack continued: "You needn't mind tellin' me one bit, for it was the funniest thing—mother and me was havin' a chummy talk out by my rabbit pen this morning, and I jist happened to say to her I was glad Cliff Ross' mother wasn't mine. So you see you needn't feel bad about what you said. I jist happened to hear you say that to Mrs. Brown, and it made me wonder if my own mother saw anything wrong with me and didn't like to tell a fella. Thought I'd jist ask you, so I'd know. I wouldn't like my mother to be disappointed in me, you know."

"And pray why wouldn't you like me for a mother?" asked Mrs. Ross, slightly piqued, for she prided herself on being a model mother and having the neatest-dressed boy in the town.

"Well, you tell me fust why I'd break your heart, and I'll tell you why I wouldn't like you for a mother," answered Jack, with all a small boy's love of making a bargain.

"Well, Jack," said Mrs. Ross, sitting down on a chair on the veranda, while Jack took a seat on one of the steps, "I just couldn't stand it if Clifford puddled around in the mud like you do, and climbed trees, and into barns, and all those things. Why, it must keep your mother's nerves in an awful state! And she must be darning all the time. You never keep a hat on your head, and you're freckled and burned; and you go swimming in the creek, and go home with your boots strung around your neck oftener than with them on your feet. Why, I would be frightened to death if Clifford did some of the things you do!"

"Is that all?" and a relieved look brightened up the grimy little face. "If that's all, why, mother don't mind them things much."

"You see, when I puddle in the mud it's for speciments," he confided. "Oh, yes," as Mrs. Ross looked incredulous, "the pollywogs I was gettin,' me and mother is goin' to keep in a big dish of water, and watch 'em turn into frogs. She says first they get the'r front legs, then the'r hind ones, 'nd then the'r tail drops off, 'nd I can hardly wait to see 'em. 'Nd look here," he continued, and forgetting for the moment to whom he was talking, he pulled a dirty handkerchief out of his pocket and, carefully untying it, showed her a huge black caterpillar. She shivered, but Jack failing to notice the shiver, handled the caterpillar lovingly. "Mother and me will look at him with daddy's magnifying glass tonight," he said, 'en look it up in one of daddy's boks."

"Cuckoos and orioles like these to eat," he informed her. "I guess it's the custard inside 'em. Mrs. Ross shuddered again.

"Where's Cliff?" he asked; "he'd like to see this fella."

"You mean, Clifford," answered Mrs. Ross, stiffly. "He's away on an errand, but I hardly think Clifford would care to handle such a thing as that."

"Oh, yes, Clifford; but you know he likes us fellas to call him 'Cliff, old man.' 'Nd oh! yes, he likes bugs 'nd grubs 'nd little snakes 'nd things. He gets me to keep some for him sometimes, 'cause he says you don't like 'em 'round. So I keep 'em for him, 'nd he jist looks at 'em when he gets a chance."

"You are a funny boy, Jack," sighed Mrs. Ross. "You haven't yet told me why you wouldn't like me for a mother," she continued, inquiringly.

"Well," said Jack, sizing her up, "it isn't because you don't look nice, for you're a real pretty woman to look at, but you see a fella likes his mother to be chummy, and not to be awful particular.

"Now you keep Cliff—Clifford, I mean—awful nice 'nd clean and dressed up, 'nd of course he does look nice; but some of the boys call him sissy, 'nd he doesn't like that. 'Nd he does look so lonesome sitting on the bank when the rest of us fellas go in for a swim; 'nd when we climb trees to look into birds' nests we have to tell Cliff how many eggs there are 'nd what color, 'cause he darsen't climb the trees 'cause he might tear his clothes or scratch the leather all off his shoes.

"He never can go barefoot, 'nd he don't get strong like me. Why, see I could lick Cliff in ten jerks of a dead lion's tail," he said, as he swelled out his little chest and doubled up his grimy fists. "Only I don't," he hastened to say, smiling on her reassuringly, as he noticed her horrified look.

"Yes, Cliff is a good sort if he didn't have to be dressed up all the time. He shares everything he gets with the rest of us, 'nd he's game; you can't make him cry.

"My mother says maybe I'll be a science master at the high school, like father used to be before he died; so she lets me learn all about bugs 'n things," he told her, speaking softly.

"Well, I must be goin' home. Mother'll be looking for me. I'm awful glad there isn't anything wrong about me but the climbin' 'nd the dirt for I'll grow out of that, mother says. Good-bye, Mrs. Ross; tell Cliff to come over and see the baby pigeons I've got—just hatched." He jumped the fence instead of opening the gate, and was off like a flash.

Mrs. Ross' feelings were mixed, and

Digging asphalt from Trinidad Lake

Time-and-weather test is the *real* roofing test.

You want to be sure *before you buy* that your roofing will stand this vital test. The only way you *can* be sure is to know what the roofing is made of.

Genasco

the Trinidad-Lake-Asphalt Roofing

is free from mystery and deception. It has the life that only *natural* asphalt can give roofing to make it thoroughly and permanently waterproof.

The natural oils in Trinidad Lake Asphalt give it this resisting life; and they do not dry out of Genasco like the volatile oils in artificial asphalt roofings, which leave them to crack, crumble, and leak.

Genasco Roofing resists rain, snow, sun, wind, heat, and cold—and it lasts.

The Kant-leak Kleet not only makes seams absolutely water-tight without cement—it prevents nail-leaks, and gives the roof an attractive finish.

Ask your dealer for Genasco mineral or smooth surface Roofings with Kant-leak Kleets packed in the roll. Fully guaranteed. Write us for samples and the Good Roof Guide Book.

she did some thinking, with the result that Clifford appeared among the "fellas" the next Saturday afternoon in blue overalls and bare feet, and had the time of his life.—Christian Guardian.

TESTED RECIPES.

We give below two recipes which have been tested and found to be most excellent. The first for brown bread is furnished by Kathryn H. Meeder at the head of the restaurant service of Jevne's Store in Los Angeles. She vouches for this brown bread recipe that it is one of the best she has ever tried, and it looks as if it would be an easy one to test. The baking tins of baking powder cans certainly are easily supplied. The idea of placing in oven in pan of water is to partially steam as well as bake the bread.

The next recipe for clam chowder has been found most excellent. It is furnished by Mrs. F. D. Vroman of Los Angeles. It is likewise very simple and has had a test of several years.

We hope these tested recipes will bring forth others along same or other lines.

Brown Bread.

One quart Graham flour, 1 teaspoon baking powder, 1 scant teaspoon salt mixed into flour. In a separate dish put 1 cup molasses, 1 cup warm water, 1 cup sour milk or buttermilk, with teaspoon soda dissolved in the milk. Stir all together and pour over Graham flour mixture. This will make four 1-pound baking powder cans full. Put covers on cans lightly so the dough can rise. Put cans in a pan with little water and bake one hour and fifteen minutes.—Kathryn H. Meeder.

Clam Chowder for Six.

One can genuine eastern Little-Neck clams. Take three medium sized onions sliced thin; put in stew kettle with piece of butter size of an egg; cook until brown, stirring once in a while to brown evenly and prevent burning. Peel and slice thin four good sized potatoes; when onions are brown put in the potatoes and cover with hot water (enough to cover to depth of two or three inches), adding the juice of the clams. Cook from 20 minutes to half an hour till potatoes are well done. Before serving salt and pepper to taste, add the clams and a couple of broken soda crackers.

KITCHEN ECONOMY.

Hang up the broom! It will last longer, and sweep better, if properly cared for; and if always in place, is easily found. When through using the scrub-brush, wash, rinse and put to dry bristles side down. Treated in this way it is always clean and is more durable.

The period of usefulness of the vegetable brush is lengthened by half if cared for in the same manner.

Mops and all cloths used in cleaning should be washed in clean water, and hung in such a manner that they will dry quickly. They will then be clean and sweet when again needed.

Wash the dish-cloth in clean soapy water, rinse, wring dry, and hang in such a manner that it will dry quickly. Hang out-of-doors if possible.

An oiled kitchen floor, whether of hard or soft wood, is much more easily cleaned than an unoiled floor. An oiled floor is more durable than an unoiled one. Use boiled oil; heat it and apply to the floor with an old woolen cloth. Rub the oil in well. Cover the floor with papers, to prevent the oil tracking if the room be used while the oil is still fresh. If the oiling is done late in the afternoon or at night, the papers may be removed in the morning and the floor washed with cool water. If no washing of the floor is done for several hours after oiling, more of the oil will soak into the floor, and it lasts longer. Floors are much more easily cared for, and lok better, if oiled once a month.—Mary L. Bull, Minnesota University Farm.

For the kitchen sink I cut out a round piece of flat rubber which serves as a stopper, thus making it easy to wash and rinse towels, flannels, etc., in a sink full of hot water. The suction of the water holds the rubber tightly in place.

Hay.

Scott, Magner & Miller say:

Receipts of hay during the week have amounted to 5000 tons. Quite a proportion of this amount consisted of alfalfa, and of poorer varieties of hay that have been shipped in from the lowlands along the rivers. With the exception of Monday the arrivals by car of the better grades have not been large. It is plainly evident that in our better hay districts the fields have been cleared to such an extent that comparatively there will not be much more to come into our markets by rail until we begin to break into the warehouses.

The market has been well sustained for the best grades and has advanced 50c per ton on fancy lots. Strictly "gilt-edged" wheat hay, baled in lightweight bales, from the Livermore district is readily placed for retailing purposes at $18.50 here, and fancy red oat hay at $15.50. The poorer grades have not responded as yet to the advance in the choicer varieties.

There is a decided firmness to the entire situation and a feeling that the entire line must necessarily advance to a somewhat higher basis as quickly as hay begins to be drawn from the warehouses, which will soon be necessary to obtain choice lots to supply the current trade demand.

The situation on alfalfa remains just about as heretofore. Large lots are moving into market and being placed rapidly on orders previously taken.

We quote the wholesale prices in round lots on today's market as follows, viz:

Fancy wheat hay	18.00@18.50
No. 1 wheat or wheat & oats	16.00@17.00
No. 2 wheat or wheat & Oat	13.00@14.00
Choice tame	14.50@15.50

Deciduous Fruit Market

F. B. McKevitt, general manager of the California Fruit Distributors, reports:

Sacramento, Cal., Sept. 16, 1911.

The following gives the number of cars of deciduous fruit shipped from all points in California for the week(seven days) ending Friday morning, September 15, 1911:

Peaches—38½ cars. This shipment was made up principally of Salways, with a few Clings. Pracer County is now practically done with both varieties. There are still a few Salways left in one or two sections, but probably there will not be more than 25 carloads of them altogether. The movement, therefore, is practically concluded for the season.

Plums—11¾ cars. This shipment is just about one-half of that of the previous week. There are very few plums left, and it is likely that the coming week will see their finish.

Pears—65½ cars. Bartletts are now nearly gone. Fall and Winter pears are coming forward slowly, but will be in greater evidence the next two weeks. Fall pears are of unusually good quality.

Grapes—508½ cars. It is probable that shipment of this variety is now as great as it will be at any time during the season. Tokays continue to be the principal variety offered, although there are still a few Cornichons and Malagas. More of both varieties would be available if the demand justified. Owing to the very low prices prevailing for grapes in all Eastern markets, growers are generally restricting their shipments, and it is expected that there will be considerably less fruit of this variety forwarded during the coming week than in the one just passed. Grapes are now just approaching their full maturity and will be of far better quality from this on than at any previous time in the season.

Weather conditions are everything that could be desired.

Comparative statement of shipments up to September 9, 1911:

	1910	1911
Cherries	250	215¼
Apricots	289¼	214½
Peaches	2386¾	1895
Plums	1552½	1342
Pears	2214	1966¾
Grapes	1846½	1629¼
Apples	428	12
Sundry	2	....
Total	8970	7275¾

Citrus Fruit Market

LOS ANGELES, Sept. 20, 1911.

There is no material change in the Valencia situation. If anything, the demand is slightly stronger and desirable sizes are picked up in every market at good prices. The large number of small sizes forces some stock off at reduced prices. The quality is of the very best and promises to continue to the end of the season.

The lemon market is strengthening, a few foreigns are coming and the high quality of all Californias offered moves them quickly.

Shipments.

Shipments of oranges to date since November 1st, 1910, 35,943 cars, lemons 6,335, total 42,278. To same date last season: Oranges 24,738 cars, lemons 4,538, total 29,276.

NEW YORK, Sept. 19.—Six cars Valencias and one car lemons sold. Market steady on Valencias, strong on lemons. Weather fair.

Cream Separators, all sizes and prices. Guy F. Kelsey & Co., 106 East Eighth St., Los Angeles, Cal.

MARKETING CALIFORNIA HONEY CROP.

(Continued from Page 269.)

ern buckwheat honey, white clover honey and particularly the southern honeys from Florida and other portions of the South, that they contain a higher percentage of water than do California honeys; and so California honeys low in water content are in demand.

The baker uses honey for sweetening power, and to him the sugar content of the honey is an important factor. The total sugar content of the average alfalfa honey is 81.51 per cent, or about 5 per cent in excess of the total sugar content of the average honey, which average, of course, includes not only the high sugar containing alfalfa honey, but similar western honeys, such as the mesquite, blue gum and the catclaw of Texas, all ranging in the neighborhood of 81 per cent sugar content. What is of particular interest to the producer is that alfalfa honey averages 3 per cent higher in sugar content than orange honey, 4 per cent higher than sage honey, and nearly 5 per cent higher than wild buckwheat honey. It may be asked of what significance these figures are. They simply mean that the purchaser of honey for baking and other sweetening purposes can afford to pay not only as much for alfalfa honey as he does for sage honey for the same purpose, but could even pay up to 5 per cent more than he does for sage honey for the same purpose. And when this is realized and honey for baking purposes is graded as it should be according to sugar content, it will mean thousands of dollars in the pockets of the alfalfa, eucalyptus, mesquite and other high sugar content honey producers of California.

Why Sage Honey is in Demand in the Eastern Market.

Sage honey is low in water content, of a high purity type, light in color and mild in flavor. In chemical composition it approaches, with one exception, the two finest and rarest eastern table honeys—pure apple honey and raspberry honey. What would the eastern honey producer think if he could produce raspberry honey by the carload and the hundred tons? He would think he had a veritable bonanza, and he would be right—he would have what the California mountain honey producer enjoys, with the added superiority of a mild, sweet-scented flavor of the wild raspberry openings of Northern Michigan instead of the somewhat less aromatic, slightly pungent tang of the California black and white sage. But to offset this slight disadvantage, if indeed it may be called a disadvantage at all, the California producer has something that far outweighs and enhances his product with the commercial handler of honey beyond any mere shade of flavor—for he has a product of such a sugar make-up as to retard and, in many instances, prevent the granulation of the honey. This is a tremendous advantage to the buyer, dealer, bottler and shipper of honey, for to have a honey to handle that is always liquid saves hundreds of dollars in getting it in small packages to the consumer. The secret of this characteristic of sage honey is the fact that in the invert sugar content the levulose, which probably never does become crystalized, is far in excess of the dextrose, the percentages ranging for the sage honey 42.75 per cent levulose to 31.22 per cent dextrose as compared to 40.24 per cent levulose and 36.85 per cent dextrose in the average alfalfa honey—a type that granulates readily. The actual difference in levulose, 2½ per cent, is not so marked, but the decrease in the amount of dextrose in the sage honey of over 4½ per cent as compared with alfalfa honey makes a total difference of over 7 per cent in the granulating factor in the two honeys—sufficient to account for the marked non-crystaline tendency of the sage honey—the feature which, together with its other uniformly high characteristics, makes California sage honey in demand in the markets of the world.

Do your cows milk hard? Send 50 cents for teat expander. O. J. Weber Co., 225-227-229-231 East Sixth St., Los Angeles, Cal.

Veterinary

Answers in this column by Fred G. Matthews, M. S., D. V. M., 1232 Central Ave., Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Lump Jaw?

A cow purchased last June has a lump on her jaw. The bone is enlarged and the skin seems grown to the bone around an old scar. The condition has existed in its present state for two years. Is the disease likely to return?—Subscriber, Buena Park.

The dormant state of the injured part for two years practically assures the disappearance of the original active cause, whatever that may have been—an accident, an abscess, or the germs of lump jaw, and for that reason I would not anticipate further trouble.—F. G. M.

Warts.

A cow, five years old, has warts on her teats. Kindly prescribe a remedy. —Subscriber, Tulare.

Mix sulphur and castor oil to make a thin paste and rub a little of this on the warts once every two days.—F. G. M.

Teeth Falling Out.

Some of my hogs are losing their teeth. The teeth are aparently sound but after becoming loose fall out. I am told this is caused by a "screw worm." Is this correct?—Subscriber, Covina.

The pig between the ages of two and three years sheds a number of its milk-teeth and permanent teeth grow in their places. Some front teeth and some back teeth are shed and replaced during this period of life. I have no knowledge of any worm or any other animal parasite which infests the mouth and dislodges the teeth. However, this may occur in a systemic disease with malnutrition of the bones. Also some germs or mold grow in the mouth resulting in ulceration of the gums and loss of teeth. In this instance ulcers are not reported and the pigs are not otherwise ailing, hence the opinion that teeth are being shed.—F. G. M.

Exuberant Granulations.

A bad cut on the forequarters of a mare has refused to heal and now a portion of flesh as large as an egg protrudes. Burnt alum has been used but with little success. The horse seems to be in pain raising the foot continually. Is this protruding flesh painful? Would the use of bandages tend to promote such growth of flesh? Are there any healing qualities in dry sulphur?—Subscriber, Modesto.

Granulations protruding from the surface are rarely sensitive, therefore a good remedy is to apply a hot iron to the part and burn away diseased tissue till the animal begins to manifest pain. Bandaging would hinder rather than promote excessive granulations. The animal's action in raising the foot continually does indicate pain, but due undoubtedly to an injury to deeper structures—ligaments, tendons or bone. Dry sulphur is used with good results on open wounds.—F. G. M.

Lameness.

I have a horse which has been a little lame about one year. A veterinarian prescribed a blister for a "cup bone," but the use of the remedy did not relieve the lameness and I have since used other blisters with as little results, as the lameness still remains. —Subscriber, Oceanside.

Please observe that your description is incomplete, as you do not state whether the lameness is in a front or hind limb, and the location of the bone or part supposed to be affected is also omitted. Kindly rewrite your query describing alterations if any and give the symptoms in detail.—F. G. M.

"Sow an act and you reap a habit; sow a habit and you reap a character; sow a character and you reap a destiny."

Does More Work Than 40 Men

Read the letters in our free book to prove it. No machine ever invented that equals this 20th Century Grader on all work of grading and leveling roads, building ditches, levees, borders, irrigation laterals, leveling land, cutting sage brush and weeds, scalping alfalfa, cleaning streets and sidewalks and its many other uses.

Makes and saves big money Original-one-man machine. Thousands in use—all giving splendid service and satisfaction.

20th Century Grader

is built of steel—lasts a lifetime. Many important features and advantages that make it the most wonderful grader ever built. Weighs only 600 pounds. Write postal now for most interesting book you ever saw.

Pump Jacks, Pumps, Belting, Etc.

The La Verne ROTARY CULTIVATOR Is Different

The principle of Rotary Cultivation is an entirely new one; the action of the teeth in the soil being different from solid, cut away discs or ordinary Cultivators. It carries absolutely no soil with it, and can be used at a greater depth with less draft than any other cultivator on the market today. The tool works so close to the ground, with no wheels or other attachments to catch limbs or tear off fruit, that it can be used to cultivate under the trees, where ordinary tools do not reach. The manner in which the teeth enter the soil, tends to keep them sharp, and one set usually lasts a season. We guarantee satisfaction in regard to work and quality of construction.

We make special tools to order for handling special work.
Tell us your troubles.
We invite correspondence.

WRITE OR CALL ON US DIRECT IF YOUR DEALER DOES NOT HAVE THESE TOOLS.

Sub-Irrigation in Underground Ditches

Milo B. Williams, Irrigation Engineer Connected with the Office of Experiment Stations of U. S. Department of Agriculture, Writes of Systems in Other Sections of the Country

Investigations tend to show that where subirrigation has proven both economical and successful the soil, subsoil and underground conditions are different from those found on the average farm. The ideal situation for subirrigation is where water will spread laterally through the soil and subsoil to great distances before sinking below the reach of plant roots. It is probable that all agricultural lands could be thoroughly subirrigated if it were possible to apply the water to a great enough number of points a few inches beneath the surface. But as the cost of a subirrigation system increases very rapidly with the increase in the number of points at which it is necessary to inject the water into the soil, the economical limit is soon reached, and the farmer cannot afford to install the system for the benefits he would gain.

Each set of underground conditions may demand a different number of injection points, which means a different spacing of pipe lines, to give an even distribution of moisture within the root zone. Subirrigation in a loose sandy soil or a porous peat soil, either of which overlays an impervious hardpan or clay, presents conditions extremely favorable for success. Pipe lines can be spaced from eighteen to thirty feet apart, which makes the cost remain moderate. Such soils permit the water to travel through them easily, and the impervious stratum prevents the water from sinking while spreading laterally and being drawn up to the plant roots. To give the same results in a heavier and closer soil, the distance between tile lines must be less. The tendency in this case is to waterlog the soil directly over the pipe lines and leave dry spaces between, unless close spacing is used. A closer spacing of laterals is also necessary where there is no hardpan or other impervious substratum to prevent the water wasting downward. The lateral spread in this case must be done by the capillary power of the soil particles, which is extremely slow in action and will not carry the water a great distance.

Study Your Conditions.

The writer wishes to urge irrigators to study their field conditions carefully before installing a system of subirrigation on a large area. A few inexpensive experiments in the land proposed to be sub-irrigated, may be the saving of much money and result in success rather than failure.

A simple test can be made by constructing a short sub-irrigation pipe and raising a crop of field peas, beans, or some other rapid growing broadcast crop on the ground. The crop should be sown 20 to 30 feet either side of the pipe line, making a strip 40 to 60 feet for the test. The thrift of the plants will mark the distribution of the water either side of the pipe line.

It is suggested that the test line be made of common clay drain tile having an internal diameter of three inches and laid in a level trench from 50 to 100 feet in length and 20 inches deep. The tile should be laid closely and to end and the joints left uncemented. One end of the tile line should be closed and the opposite enter a small bulkhead for admitting the irrigation water. This bulkhead can be made by setting a 2½ foot section of 12-inch sewer pipe vertically in the ground with the bell end up. The lower end should set six inches lower than the bottom of the tile trench, and contain three inches of concrete to form a bottom to the bulkhead. The tile line can enter the bulkhead through a hole in the side near the bottom and be cemented in place. A water tank placed so that a faucet will stand over the bulkhead forms a convenient arrangement of measuring the water used and controlling the flow into the test line.

Test System.

It is best to construct the test system in the fall of the year and permit the refilled earth to settle over the tile during the winter season.

During irrigation, water should be maintained in the bulkhead at a level sufficiently high to cause some pressure within the tile, but not high enough to cause water to flood the surface directly over the tile.

The two important factors to be determined in a test of this nature are the amount of water consumed by the soil during the growth of a crop, and the area irrigated by one tile line. The amount of water used can be measured in the water tank and the area irrigated by the boundaries of a good crop. Knowing these factors gives the irrigator substantial data for use in the designing and estimating of the cost of a system of sub-irrigation adaptable to his individual conditions.

Several other factors may be brought out in the course of the experiment. The quantity of water absorbed by the ground beneath the root zone may be excessive and indicate sub-irrigation impractical. A large amount of water may be absorbed in the beginning of the season, but gradually after the substrata becomes saturated, less and less will be required to supply the crop. Under some soil conditions the water may be taken extremely slow, and several days or even weeks be necessary to reach the maximum spread from the tile. The ground directly about the tile may become oversaturated and destroy the crop at that point without irrigating a desirable distance away. Many of these factors could be determined in less time if the irrigator is prepared to make soil moisture measurements during the operation of a test system.

The type of construction used in the above test should not be taken as a desirable design to use in a permanent system. A permanent system should be designed to meet the individual's land and crop conditions.

Sub-Irrigation at Sanford, Florida.

The conditions in which sub-irrigation is being practiced about Sanford, Florida, are peculiar to farming and farm lands and should be noted carefully by the prospective sub-irrigationist. This section has the largest tile-sub-irrigated area in the United States and follows a simple line of construction.

In the beginning, the land must be drained before it can be farmed, the system of sub-irrigation used gives an ideal system of drainage for the crops grown. The crops cultivated are all shallow rooting, consisting principally of celery, lettuce, egg-plant and other valuable vegetables. The fact that only shallow rooting crops are grown, eliminates the danger of the system of tile being stopped with roots, a factor which has caused the failure of many sub-irrigation experiments with deep rooting crops.

The soil is extremely open, sterile sand, increasing in coarseness and porosity as the sub-soil is entered. Below the subsoil is generally found an impervious stratum of marl, clay or stone. These conditions of ground form a soil reservoir in which water permeates freely and is prevented from escaping below the reach of plant roots.

The topography of the ground is extremely even, having slight grades which permit the tile lines being laid on flat continuous grades and remain the same depth in the ground at all points.

System.

The Florida sub-irrigation system consists of a series of parallel lateral pipe lines, fed by a main supply pipe or header and emptying into a drainage ditch or tile line, with the necessary controlling structures for injecting water into the soil by gravity flow.

The laterals are spread from 18 to 20 feet apart and placed in trenches 18 to 20 inches deep. Little fall is given to the tile, generally about two inches to the 100 feet or less. Common clay drain tile, 12 inches in length and three inches in internal diameter are standardly used. The tiles are laid closely end to end and a shovel full of sawdust, cinders or waste placed over each joint to prevent the sand entering the tile. Controlling boxes or "stop pockets" are placed in the laterals at their inlet and outlet and intermediately spaced from 200 to 400 feet, to give entrance to the line for checking, releasing and controlling the flow of water. The stop-pockets consist of vertical sections of 12-inch tile set in the ground intersecting the laterals. They enter and leave the stop-pocket through holes cut in opposite sides near the bottom. The bottom and connections are made water tight with cement. To form a weir within the stop-pocket for use in checking the flow of water in the lateral, a concrete wall one inch in thickness is cemented into the pocket. The wall is set vertically and perpendicular to the lateral and in such a way as to divide the pocket into an inlet chamber controlling one-third the space and an outlet chamber twice as large. The wall contains two metal lined holes on its center line, one is three inches in diameter and directly in line with the bore of the lateral. The other is two inches in diameter and placed six inches above the larger. The top of the weir wall comes within about two inches of the top of the pocket, so that when all the holes are closed the water will pour over from one chamber into the other. When the system is being used for drainage the holes in the stop-pockets are left open so that the water can pass through freely. When the system is being used for irrigation the bottom hole is closed with a wooden plug and the water is checked until it backs up in the tile line under a pressure head of six inches. If this pressure is not sufficient a second plug is placed in the upper hole and the water forced to go over the top of the weir wall, which places a pressure head of about 12 inches on the tile line.

The pockets used at the inlet of the laterals do not contain the weir wall as their office is only to control the amount of water entering the laterals. The connection between the inlet pocket and the supply main contains a short length of two-inch iron pipe cemented into the connecting tile, thus forming a plug hole. A system of plugs are used in the inlet pocket to assist in letting in different quantities of water. This consists of two-inch plugs having different size holes through their centers into which a second set of hollow plugs fit.

The main supply pipe in the Florida system follows the high ground or the high side of the field, intersecting the heads of the laterals. The main is built of four or five-inch bell-joint, vitrified clay pipe with the joints cemented water tight. At the intersection of each lateral head a hole is cut into the side of the main and the connecting tile and iron pipe cemented into place between the main and the lateral stop-pocket.

In systems where the main intersects the heads of two laterals, leading in opposite directions at the same point, a stop-pocket is placed intersecting the main and a lateral taken from each side of the pocket.

The cost of installing the sub-irrigation systems of Florida ranges from $80.00 to $100.00 per acre exclusive of the water supply.

The Florida systems are mostly supplied with water from flowing wells which discharge directly into a bulkhead at the upper end of the main supply pipes, and the flow being controlled with common steam brass valves.

Wiggin's Sub-Irrigation System.

A system of sub-irrigation known as the "Wiggin's System" is being developed and promoted in Kansas and adjoining states. A company has been formed for the purpose of selling rights for installing the system and the leasing of their patented machines for making a continuous concrete tile.

The conditions under which the Wiggin's system is being tested are more representative of average farm conditions, but less favorable for free lateral moisture movements than those under which the Florida system operates. The soils and sub-soils are heavier and closer; the sub-strata are not as uniformly impervious; the lands are often uneven and rolling; the crops grown are not confined to one class, but all farm crops raised from the garden trucks to orchards regardless of their rooting depth.

Sub-Soiling.

The system is not designed nor used for drainage purposes.

Before the system is installed the promoters recommend the sub-soiling of the land. A plow having a special point and trailing a short piece of gas pipe, upon which the dirt falls, tends to leave a "mole hole" beneath the surface. This is done at right angles to the laterals of the system and at intervals of about four feet. Investigations indicate that "mole holing" the soil assists the lateral spread of the water in the beginning, but is not a permanent help unless repeated occasionally.

The Wiggin's System of sub-irrigation consists of a series of underground parallel pipe lines and an intersecting main supply pipe, in which water is conducted under pressure and injected into the soil through nozzles.

Citrus and Tropical Fruits

MORE ABOUT PAPAYA.

By F. H. Bolster.

I read with interest the statements in regard to the papaya in your paper of September 14th. I was interested because during a residence of three and a half years in the tropics the papaya was one of my favorite fruits and I have eaten it in various forms.

Papaya salad is one of the most delicious salads I have ever tasted. It is used in a green state for this and is chopped fine together with the other ingredients of the salad.

The ripe fruit may be eaten with a spoon like a muskmelon is eaten. I think it is not generally liked the first time it is tasted, but after one has acquired a liking for it one can eat it every day as long as the season lasts. It contains a ferment which makes it very digestible.

The papaya has virtues enough without overstating them, as they were overstated in the article referred to. That the ferment when uncooked may have a certain amount of digestive action upon raw lean meat is probably true, but the amount is not noticeable. I have squeezed out the milk from the green papaya upon raw carabao meat and left this together with the fruit in contact with the meat for twelve hours, yet after that amount of time I failed to detect the least softening action upon the meat due to the papaya.

I have eaten green papaya cooked with meat very often. It is the general belief that cooking papaya with meat softens the meat. This is untrue. The softening claimed is credited to the ferment in the fruit. Now I am told by doctors and chemists that ferments are destroyed by heat. Therefore the ferment would be destroyed before it could cause any softening effects.

In the tropics the papaya is capable of withstanding most adverse conditions. While it responds to care and a fertile soil it is often found bearing its load of fruit hugging the trunk on the most barren and rocky soil.

There is a male papaya plant and a female papaya plant, the fruit being borne by the female plant. One can not tell which is the male plant or which the female plant till the first blossoms appear, which is when the plant is from six months to a year old. Now the most remarkable thing about the papaya relates to this matter of sex and seems incredible. If the male papaya plant is cut off smoothly at the surface of the ground as soon as the blossoms show the sex of the plant the shock seems entirely to alter its nature, and as soon as the shoot from the stump reaches bearing age, as it quickly does, most of the flowers will be female and produce fruit. I did not believe this until I actually saw the experiment tried, although the commonly accepted belief among certain Filipino peoples.—F. H. B., University Farm School.

DOUBLE YOUR CROPS.

By Ernest Braunton.

Ever since man first tilled the soil, the most serious problem offered him for solution has been to increase crop production, and all scientific study, intelligent methods and practice, in fact man's best effort, have been bent to the attainment of this end. Deep tillage, rotation of crops, increased fertilization, all are practiced today to a far greater extent than ever before, and to these has of late years been added the most potent factor of all—green manuring, or turning under (at the proper time) leguminous cover crops.

During late years, when the most intelligent practice has been in vogue, the greatest struggle has been toward procuring the necessary amount of nitrogen, that most precious and most necessary of all plant food; a struggle that has happily culminated in the improved handling of inoculated cover crops. It is now generally conceded that all milestones leading to perfect success have been passed, and we have now arrived at the goal of heaviest possible crop production. The up-to-date, top-notch grower now depends upon the nitrogen-gathering bacteria for his supply of this otherwise expensive element of plant food, and no longer pays heavy tribute to so-called "nitrate kings." In the early stages of development, when Dr. Moore, of the United States Department of Agriculture, was demonstrating the practicability of his wonderful discovery, proper methods of transportation of nitrogen-gathering bacteria had not been worked out, though even then few failures were recorded. Now, growers of every kind of leguminous crop may obtain these most necessary microscopic workers with the same ease and dispatch that his daily paper or a package of flower seeds reaches him. The discovery of a transparent jelly, devoid of nitrogen, in which the legume plants could be grown when supplied with nitrates by nitrogen fixing bacteria, and in which no other kind of bacteria could live, gave a perfect method, not only of selecting pure specimens, but of breeding up the organisms to secure those with the highest power of producing nitrates. Now you may carry home nitrogen fixing bacteria in your pocket or have the mail carrier deliver them at your door.

All the mystery that once seemed to surround this method of increasing crop production is now swept away, and all tillers of the soil know that the value of a legume crop, such as clover, peas, vetch, alfalfa, etc., as a means of enriching the soil, is due to the fact that certain kinds of bacteria which live on the roots of these plants have the power of taking nitrogen from the air and changing it into nitrates to feed the growing plant. They also form nodules, or storehouses, on the roots, in which large quantities of nitrates are held, to be released by the gradual decay of the roots, and thus make available for the use of following crops of other kinds. Every nodule is like a bee hive, full of industrious workers, making nitrates instead of honey. Nodules contain as high as 8 per cent of nitrogen; mixed stable manure only one-half of one per cement.

The amount of increase in crops caused by these bacteria almost passes belief, and if it were not that the United States Department of Agriculture has obtained the most phenomenal increase yet reported (1000 per cent), people could not believe the immense profits accruing from their presence in the soil, but Bulletin No. 71 sets all doubt at rest.

CARE OF LADYBIRDS.

Having query recently as to best way to encourage that little friend of the farmer, the ladybird, known to entomologists as hippodamia convergens, we wrote to the office of the state horticultural commissioner and Mr. Frederick Maskew, connected with the work of the commission and engaged for several months in the distribution of these insects, gives the following suggestions which we imagine are the first ever printed:

"In cultivated areas where our native species of ladybirds have been introduced in great quantities, or where they have naturally congregated in large numbers due to the presence in abundance of other insects suited to their food requirements, they are often found hibernating in shocked corn, loose corn stalks, or other debris in adjacent corn fields during the winter months that follow. Another favorite rendezvous for hippodamia convergens in the cultivated valleys of Southern California is the fields, or rows, of stock beets (mangel wurzel) that have been left growing throughout the winter. Underneath the dry, older leaves which cling closely to the upper part of the beet and among the bases of the leaf stems at the crown of the beet, may often be found large numbers of ladybirds of different species during late winter and early spring months. The natural selection of these localities would lead us to believe that they furnish all the requirements necessary to the successful protection of these insects during the hibernating period.

"I have no knowledge of any instance where either of the foregoing

have been especially used for the purpose of protecting ladybirds, but both of them are so simple that they might easily be tried as a test case. In the case of melon fields it would be a very simple matter to plant a dozen rows of stock beets along one side of the field and leave them in position until the melons were grown the next season. This method would not interfere with the cultivation of the field, as would an attempt to use bundles or shocks of corn fodder for the same purpose.

In regions adjacent to the hills in practically all parts of California, ladybirds, especially hippodamia convergens, promptly seek the recesses of the mountain canyons on the approach of winter, and it is doubtful in my mind if any attempt to provide artificial protection would overcome this force of instinct in such localities.

"While it is considered desirable that every means should be used both to attract and hold these valuable insects in the immediate neighborhood of field crops susceptible to the attack of aphids, it is well to remember that one of the functions of the state commission of horticulture is to furnish colonies of ladybirds to all producers whose crops are in a condition to need them. The state insectary as a result of long experience and experimentation has devised economic ways of collecting, packing and storing these insects in almost incredible numbers, and the available supply each season is limited only by the demand for the same. Colonies are delivered free of all charge, the express company carrying them free, in recognition of their valuable work in the production of larger and cleaner crops, and the only effort required on the part of the producer who expects to need the assistance of these insects during the coming season, is to send in an application and the extent of his plantings, before the expiration of the collecting season, which usually culminates the latter part of the month of February."

SCIENTIFIC CARING FOR FRUIT.

Dr. Surface, state Zoologist of Pennsylvania, says that plant pests are annually ruining property valued at $10,000,000 in Pennsylvania. That is good and sufficient reason why the state department of agriculture should send a special train over the state and try to save the orchards, by means of lectures by men who know whereof they speak and can give valuable information and advice for fighting the pests.

"Plant pests are chiefly of three great groups, each of which demands its own kinds of remedies and its own time of application. These are the plant diseases, such as the rusts, smuts, blights, mildews, leafspots, cankers and leaf-curl. Most of these are preventable rather than curable, and the successful art of the husbandman lies in applying the proper preventive material called a fungicide, because used to prevent fungi before the tissues of the leaf, fruit or other part commences to show injury by the disease. The standard fungicide and the one still generally acknowledged as the best is the Bordeaux mixture, made by mixing three pounds of bluestone, or copper sulphate, and four pounds of quicklime in fifty gallons of water. This will not kill insects, but will drive away a few kinds. It is properly used only to prevent plant diseases.

"The second great group of plant pests is that known as the chewing insects, such as worms or caterpillars of all kinds, potato beetles, wrongly called bugs, the codling moth and all others that eat the tissue of the plant. These can be destroyed only by the application of poisons chief of which are arsenate of lead, two pounds in fifty gallons of liquid, either water or Bordeaux mixture, and Paris green, one-half pound in fifty gallons. The former is preferred, as it stays on the plants and is effective so much longer.

"The third great group of plant pests is that comprising the sucking insects, such as all scale insects and plant lice. These are not killed by poisons, but by contact insecticides, such as the lime-sulphur solution applied when the trees are dormant, or kerosene emulsion, or one pound of whale oil soap in five gallons of water applied when the plants are in leaf. This is the essential outline of the chief features of pest suppression."—Green's Fruit Grower.

QUEER MORALITY.

Upton Sinclair, in a lecture in New York, condemned industrial or business morality.

"It is all wrong," he said, "but every one thinks it is all right. It reminds me of Tin Can.

"Once in a Tin Can poker game a tenderfoot saw a player give himself four aces from the bottom of the pack. The tenderfoot flushed with indignation. He turned to a Tin Can native and whispered:

"'Did you see that?'

"'See what?'

"'Why, that hound dealt himself four aces!'

"'Wall,' said the native, in a surprised tone, 'wasn't it his deal?'"

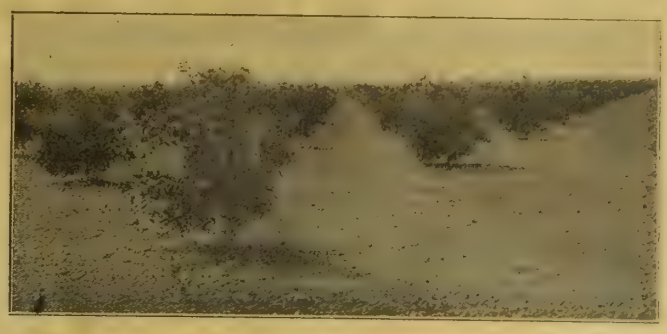
Irrigation Plants of any Capacity Installed Complete and Guaranteed Economical in Operation

SMITH - BOOTH - USHER CO.
228 TO 238 CENTRAL AVE.
LOS ANGELES, CAL.



Citrus Trees Exclusively

We have to offer for planting season of 1912 an excellent stock of strictly first-class Citrus trees in all varieties.

REMEMBER, MR. PLANTER, we have had twenty-one years of experience in the successful propagating of Citrus trees, and while our prices might be a little higher than our competitors, we absolutely guarantee our trees true to name. We are in the business to stay; hence, can back up what we say.

THINK WHAT THIS MEANS TO YOU. The average nursery is in business today and out tomorrow, so you have no recourse should anything go wrong. In addition to guaranteeing our trees true to name, we select our buds only from best individual fruiting trees, which would eliminate the possibility of having non-fruiting trees, or poor bearers in your grove. We follow the same plan of bud selection as the government experimental work.

CONSIDER THIS FULLY. One tree that will not produce after five years of work and attention will have cost you fully TWENTY TIMES its original purchase price. YOU CANNOT AFFORD TO TAKE CHANCES.

Our booklet, entitled "Citrus Fruits," mailed to any address on receipt of 25 cents; credit given for this amount on first order.

Write us today for prices and information. All correspondence most cheerfully answered.

San Dimas Citrus Nurseries
SAN DIMAS, CAL.

Fertilize With Air

The nodules on these roots are colonies of bacteria that suck the nitrogen from the air and store it in the plant, which then becomes a valuable fertilizer. The bacteria were placed there by inoculating the seed with

FARMOGERM
(High Bred Nitrogen Gathering Bacteria)

Science has thus brought the wonderful possibilities of bacteria fertilization to a thoroughly practical and simple method of application.

This places within reach of every grower an enormous increase in the tonnage and fertilizing value of

COVER CROPS

Vetch, clover, fenugreek and all legumes can be inoculated with Farmogerm at a nominal expense and by a simple operation, or we will treat the seed for our customers if preferred.

LUCEY GUARANTEE

DO YOU WANT A

Pumping Plant

THAT YOU CAN DEPEND ON?

Then it must be one that is designed expressly to meet your requirements, every part proven by time and service in other plants to be perfectly adapted to do the work it will have to do in yours.

This company is not committed to any one type or system of pumping, but we know the pumps that have given satisfaction and what their working conditions must be, and by means of this knowledge, can take your case, consider all its phases, then outline a plant that we know is bound to absolutely meet your requirements.

Our price will be either f. o. b. Los Angeles, or as we would prefer, installed complete at your well in perfect running order and doing just what we have told you it would do.

Write us your conditions fully or ask us to send you a card to be filled out. We will quote you a price, a good one, and remember it will cover a plant that you can depend upon.

WHY you should have

A Likfreshing Plant

BECAUSE you can easily and cheaply convert your perishable fruits and vegetables into staples.

LIKFRESHED products are superior in every way—less loss of weight and food contents—less sulphur required. Superior flavor and keeping qualities—"Just Like Fresh." Cost of installing plant is nominal. Expense of operating is less than sun drying. For other reasons and full particulars, write or call. Be sure to look into this matter this season, as it will prove a money maker for you.

Deciduous Fruit Culture

WALNUTS—GREEN MANURE CROPS.

A subscriber having an orchard in the Santa Clara Valley writes as to green manure crops for walnut orchard and as to forcing such orchard to heavier bearing. The matter was referred to Mr. J. B. Neff of Anaheim and he writes:

Green manure crops of legumes are almost equally valuable per ton, so it becomes a question of growing the crop which produces the largest tonnage. Stable manure adds phosphorus and potash to the soil and has about the same amount of nitrogen per ton as is found in green manure crops. Leguminous crops add nitrogen to the soil but do not add potash and phosphorus. Green manure crops cost less per ton usually than stable manure. When leguminous crops cannot be grown and stable manure is not available, humus can be added and the mechanical condition of the soil improved very much by growing a winter crop of rye. All green manure crops should be plowed under when there is sufficient moisture in the ground to cause them to decay rapidly. The ground should be well firmed by running a disk harrow, set straight, over the ground as soon as the plowing is done.

"The walnuts should be gathered as soon as possible after they are ripe, rather than let them hang on the trees until they fall. In this way the green crop can be sowed earlier and will not require so much irrigation in the spring. Peas will grow in cooler weather than vetches, but usually do not make so much tonnage.

"Innoculation should be practiced on land which has not had crops of legumes. Soil can be taken from a field where the particular crop has grown luxuriantly and placed in a bucket. Then pour water over and stir, using water enough to have a few quarts more than the soil will hold. Allow the water to settle a few minutes and pour off the muddy water to use in dampening the seed for sowing. Do not dry in the sun but sow as soon as dry enough to handle. One quart of the water will inoculate 200 pounds of seed.

"Keep the soil always wet enough to have the trees in good growing condition until the nuts are gathered. In addition to the manure and green crops plow in 500 pounds per acre of 18 per cent superphosphate each year and keep the ground well cultivated.

"Walnut trees should also be pruned regularly and kept open so that light can get to the inside of the tree. All dead branches should be taken out and if proper thinning is done there will be but few of the inside twigs which will die. Walnut trees should not be headed back at any time, but the branch which needs removing should be taken out clean."

"WORLD'S GREATEST."

A peach grower at Selma puffs up over the performance of his ten-acre orchard and claims for it the world's greatest. We will not talk for him, however, but quote regarding the place of Mr. C. H. Schmidt from a communication in the Fresno Republican:

"'The world's greatest peach orchard,' are the words that Mr. Schmidt uses, when he speaks of his place and offers a defi for any one to show its equal. There are ten acres of peaches on the place, half of the acreage being planted to Tuscan Clings, and the remainder to Phillips Clings. The orchard is three years old, and already has the record of producing twenty-five tons of fruit last year, when the trees were two years old. This year the yield will be upward of fifty tons. This is a conservative estimate, because the Tuscans which are the lighter crop, have already been harvested and amounted to twenty-five tons.

"While Selma is proud of the showing made in this orchard, and naturally takes much credit for the possibilities of her soil, it is but just to give Mr. Schmidt liberal credit, too, because he is an ardent exponent of intensive farming, and that he is successful is evidenced by results he has accomplished. There is nothing new or wonderful, however, about his system. To begin with, Mr. Schmidt is quite extensively engaged in the chicken business, and at all seasons when possible, the thousands of chickens are permitted to occupy the peach orchard. Besides this when the orchard was first planted, Mr. Schmidt planted alfalfa between the trees, to loosen the soil. The alfalfa, which in itself yielded some profitable crops, and furnished green food for the fowls, was permitted to stand until this spring when it was plowed under the soil to furnish fertilizer."

"Not only does Mr. Schmidt challenge others to equal his ten acres of peaches, but he takes an interest in exhibiting it to others who are interested in peach culture with a view of producing more values from their orchards."

AN ALL-AMERICAN FERTILIZER.

The field force of the United States Geological Survey is prosecuting searches for deposits of minerals which shall furnish the three necessary elements of plant food that are contained in "complete fertilizer," namely, phosphate rock, nitrate salts, and potash salts. The Survey has already discovered and surveyed enormous deposits of phosphate rock, and 2,398,590 acres of public land containing phosphate, withdrawn at the recommendation of the geological survey, are now waiting legislation by congress to enable their development. In order, however, to insure an "all-American" fertilizer, regardless of importations from other countries, it remains to discover deposits of nitrate of soda and potash salts. As both of these minerals are readily soluble and are not to be found as "outcrops" like ordinary rocks, the mission of the Survey is not an easy one. Nevertheless, it is believed that the geologic conditions of the arid West favored the accumulation, during earlier periods of the earth's history, of both of these salts and that if these still exist in concentrated deposits it is only a question of search to discover them. Hardly anything could be suggested which would be of greater assistance to the American farmer than the discovery of commercial deposits of either of these necessary fertilizing minerals.

SUBIRRIGATION.

(Continued from Page 289.)

The promoters space the laterals from 30 to 60 feet apart, depending upon the type of soil. The laterals are constructed in trenches 20 to 24 inches deep by a patented machine, which builds a continuous concrete tile of small bore. As the water is carried in the laterals under pressure, the pipes are not laid on a continuous grade, but run at uniform depths parallel to the surface profile. At intervals of four feet holes are made in the top of the pipe when soft, and a small concrete nozzle inserted. Each nozzle contains a small hole, and projects about one-half inch above the shell of the pipe. The size of hole in the nozzle varies from the different pressures to come at different points in the system due to gravity heads. The nozzles are protected by concave concrete caps which saddle over the openings to prevent earth and roots from entering. The cap forms a cavity about the nozzle and is cemented fast to the pipe in such a way that the water is forced out along the sides of the pipe. The efficiency of this arrangement for keeping roots from entering the pipe has not been tested by time.

The main supply pipe in the Wiggin's System follows the high ground or the high side of the field, intersecting the heads of the laterals. The main is built of concrete with a machine similar to the one used for laterals, only for larger pipe. Holes are cut in the sides of the main for lateral connections which are made of concrete.

Pressure.

The water is controlled in the Wiggin's System with a specially designed

valve at the head of each lateral. The water supply is usually pumped into a storage tank which is located at an elevation sufficient to produce some pressure on the system. The principal object of placing pressure in a system of this nature is to assist in the use of small pipes, and not for forcing water into the soil as one might be led to think. The more pressure placed in the system, the more water can be forced through a small pipe and out of the nozzles, but as soon as the water leaves the nozzle the pressure inside the pipe line exerts little influence over it. It depends here upon the capacity of the soil to take water, and if water is supplied faster than the soil can absorb it, the soil will become water-logged directly about the tile, or the water will waste downward.

The two systems of sub-irrigation outlined above cover the types of construction which have gained the most headway in the fields. Variations of these types have been installed by individual farmers, but their success has not led many others to adopt their methods.

The detail of construction best suited for injecting the water into the soil from an underground pipe, and yet prevent the entrance of growing roots has caused a great many different designs to have been tried. The writer believes it useless to attempt the sub-irrigation of deep rooting crops with tile or pipe having open joints or any unprotected openings.

The idea of using porous pipe is often advanced, but we have failed to find a construction which will give the proper degree of porosity, sufficient strength to stand earth stresses and yet keep out the roots. Porous pipe made from concrete tends to become less porous with age and use, also are subjected to the action of effective acids or salts in the water or soil which may cause them to break down.

A plausible construction for protecting openings in underground pipe has been advanced in the form of a porous concrete diffusion block. The block is shaped to saddle over a small opening in a pipe where it is cemented into place. It is sufficiently concave on the lower side to form a small water chamber between the pipe and block and about the pipe opening, the edges of the block resting continuously on the pipe in cement. Water coming from the pipe is forced through the structure of the block and not between the pipe and block surface. Water in this way appears on the outside in the form of sweat. The exposed surface of the block can be made in any convenient form. An oval block four by six inches and one and one-half inches in thickness has been adopted by the inventor. The block is made of screened small gravel containing sand and Portland cement, in proportions of about five of gravel to one of cement. The cement holds the stone particles together at their contact points, but leaves a very porous structure. Experiments tend to show that roots will not enter diffusion blocks made in this way, however sufficient time has not been had to give definite results.

Caution.

Farmers located in sections of scanty rainfall should adopt sub-irrigation with caution. The constant application of water to the sub-strata and its rise to the surface is apt to bring the accumulation of dangerous alkalis in the surface soils which in time may destroy the usefulness of the land for farming. In sections where there is a heavy rainfall at some period of the year, or where it is possible to flood the surface and the water can be drained off, the danger of alkali is not as great, but is a factor that should always be kept in mind in our western states.

Make Your Fall and Winter Dairying Profitable

The wasteful losses of any "gravity" setting system or poor cream separator are always greatest when the milk is often cool or the cows are old in lactation, and under these conditions, with butter prices highest, the use of the best cream separator becomes even more important than at any other season, so that a

DE LAVAL

Will Save Its Cost by Spring

With any setting system you are wasting at least a quarter of your product at this season, with cream and butter values highest, while the superiority of the De Laval to other separators is always greatest under the difficult conditions of separation, particularly in the skimming of cool milk.

Why delay your purchase of a De Laval until another Spring. Put it in now and let it save its own cost meanwhile. And as to that you may either buy for cash on on such liberal terms that the machine will actually pay for itself.

You may prove all this by test to your own satisfaction. See the local De Laval agent or communicate directly with the Company.

Live Stock and Dairy

Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.

CALIFORNIA DAIRY SCHOOL.

The regular Short Courses in Dairying will be given at the University Farm, Davis. These courses are for the benefit of California creamerymen and dairymen, and have proven very popular for those whose duties are so confining as to prevent absence for any great length of time. There is no one in the dairy business but who would profit by taking such a course, and everyone so engaged should plan to do so at some time. The work, while necessarily general, is very practical and applicable under ordinary conditions, and is given under the direction of those who have opportunity to keep up with the advancement of the science.

Dairy Manufactures.

This course, seven weeks in length (October 2 to November 18), is given for those interested in creamery and cheese factory work. It will begin with a study of the secretion and composition of milk, separation and handling of milk and cream, and will take up all phases of the work connected with the manufacture of butter and cheese. Aside from the class work, the time will be spent in the creamery, cheese factory, dairy testing laboratory and engine room, all of which are well equipped for properly accomplishing the object of the course. The approved methods of butter making, such as pasteurizing, ripening, use of starter and moisture control will be taken up, different kinds of cheese, including Cheddar, California and several soft, fancy types, will be made, and all of the more common dairy tests will be worked with. It is planned to pay special attention to dairy mechanics, such as pipe fitting, belt lacing, soldering, boiler and engine work, refrigerating machinery and motors. There will be demonstrations in dairy bacteriology, and a system of creamery accounting will be carefully studied.

Breeds, feeding and judging of dairy cattle will be interesting features.

Dairy Farming.

This course (Oct. 16-28) is intended especially for dairy farmers, and will cover essential points in the breeding, feeding, care and judging of dairy cattle, herd testing, the handling, pasteurizing, cooling and bottling of market milk and cream, the Babcock test and separator practice. All of these subjects are of great importance to dairymen.

CALIFORNIA HOLSTEIN BREEDERS.

By J. W. McAllister.

An event of great importance in the promotion of the interests of pure bred dairy stock in California took place during the Sacramento State Fair last week. The breeders of pure bred Holstein-Friesian cattle met and formed an organization known as the California Holstein-Friesian Association which will in a short time include three or four hundred members throughout the state.

Dairy Barn, University Farm School.

Mr. Chas. Webb of Los Banos was elected president and J. W. McAllister, Jr., of Chino, was elected secretary and treasurer. Other members are the Los Angeles County Farm, the Vina Ranch of Stanford University, A. W. Morris and Sons of Woodland, C. N. Brown and Son of Porterville, P. H. Davis of San Anselmo, S. K. Herzog Co. of San Raphael, T. J. Gilkerson of Stratford, L. A. Hall, San Jose; A. B. Kendall, Modesto; J. W. Benoit, Salida; H. E. Cornwell, Modesto, and F. Stenzle, San Lorenzo.

Buildings on University Farm.

It was decided to ask every person in the state interested in Holstein cattle to join this association, rather than restrict it to owners and breeders of only the pure breds because it is the desire to encourage and bring those dairymen and farmers with only the grades to see the benefit and the greater profit to be derived from the pure bred. California has in the past taken a second place as a dairy state and many of those who pioneered in the breeding of pure bred dairy cattle became discouraged and left the field, but the people are beginning to realize the superiority of the pure bred and especially the superiority of the pure bred Holstein over all other breeds and it is one of the objects of this association to foster and nurse this growing interest and put California in her right place amongst the great dairy states.

A dairy farm near Tulare now being fitted up gives promise of being the finest equipped dairy farm in the state

THE BEST MILCH GOAT IN THE WORLD.

By B. A. R. Stocker.

There are several points about the Nubian goat that commend it above all others for subtropical California, where it should thrive to perfection. Some of these points appeal particularly to the woman fancier.

The Nubians are much the largest breed of goats, and the most gentle and peaceable of any, easily contented in a small range. They are hornless, though, as in all breeds, occasionally a kid is born with horns. They have clean, close coats, with never any smell. The does are very prolific. Of them such astonishing yields of milk as eight to eleven quarts are recorded, and this milk is the creamiest in the world.

They have beautiful, long, drooping ears, very fine in texture. As to color, there is considerable latitude. The one I have is copper red, with a little white in his tail. Some are deep red tan with black points; some dappled like a fallow deer; some pied black and white, or red and white, with other beautiful combinations. But the type remains. So there is not the monotony to which we should have to resign ourselves if we knew beforehand that all the kids next spring would be, say, white.

Nubians have been bred in England for many years; and there is no doubt that they will do much better in California, with the right kind of care. But at present they are extremely scarce.

RACES AT STATE FAIR.

By J. A. Filcher.

Editor Cultivator: I have read your comments on the late State Fair, and on the whole they are just. You, like many other writers, however, seem to criticize the discrepancy between $10,000 for a race and $25 for a first prize bull. You forget that the difference is this: The horse men put up the $10,000 in entrance fees, and then go in to see who gets most of it back again, while the $25 given to the best bull, as with all other prizes, comes out of money appropriated by the state for premiums. The races are really contests among the horse men for their own money. In the case of the $10,000 race the total entrance fee for each horse when fully paid up amounted to 5 per cent of the purse, or $500. On the start there were thirty horses on which the first payment was made, and enough remained in or kept paying until the total sum received by the society for this race was $10,920. Hence you will see, Mr. Editor, that this particular race afforded all the interest and drew to the fair all the people you so graphically describe, and netted the society $920.

I trust you will publish the explanation as information to the many good people who seem to think in these fat purses the society is giving away the state's money in $2,000, $5,000 and $10,000 chunks.

Don't "dope your barbed wire or other cuts on stock. It is far better in most cases for farmers to merely protect from flies, leave wounds alone, and give them a chance to heal. This cleanliness and let-alone policy is infinitely better, in ordinary wounds, than most of the common treatments used. Farmers who try it will be surprised at the results in ordinary cases. Ordinary cuts and torn wounds, that drain freely, as a rule need very little washing. Most wounds that are doped heal in spite of the treatment—not because of it.

The Iowa Experiment Station located at Ames is issuing a bulletin on "Filling the Silo," and we have a circular which says it may be secured by writing to the station. We are not certain that this applies to out-of-the-state dairy people, but doubt not that if California dairymen should write they may secure information as to requirements for getting this valuable bulletin.

Chicago is now in line with a cold storage law compelling labeling of storage eggs as such. Violation of the ordinance calls for $50 to $500 fine.

Clipper Lawn Mower Co
Dixon, Illinois.

its agriculture they might well have seemed irresistible. England's neglect of the primary and most indispensable source of wealth and welfare, the land, has been rather a blunder than a crime. The nation never anticipated that the result of opening its ports would be the decultivation of some four millions and a quarter acres of arable land and the reduction by at least a half of the working population on the soil. It was assured that the English farmer could never be deprived of his "natural protection," and that he must always have the first and biggest share in the growing industrial prosperity of the country. Things turned out differently, and the nation never had a chance of deciding whether it desired to destroy its most indispensable industry and to become dependent on oversea importation for nine-tenths of its wheat and for three-quarters of its general food supplies.

But the British capitalists would not put their money in the industry, and the abandonment by the people of the rural districts to so great an extent present conditions that have prevented the English people from making the sugar that they consume so largely.

In very much the same way there has been in this country a strange but apparently characteristic hostility to the growth of sugar in the southern part of the United States, and in all likelihood the production of cane sugar would have been driven out of existence but for the extensive growing of beet sugar in those Northern States that are largely peopled by Norwegians, Swedes and Danes. They have been influential enough to protect their own industry in congress, and by consequence they protected ours.

There is growing up in various parts of the South a disposition of most strange unfriendliness to the cane sugar growers of Louisiana, Texas and Florida, but it is not strong enough to destroy the great southern interests that have grown into great importance in the past few decades. The Democratic party is no longer a free-trade party. It must regard actual conditions rather than ancient and obsolete questions, which, however, important once upon a time, are mere abstractions now. Moreover, the United States, with its ninety-three million population, is still a great English-speaking nation, but no longer English descended. Many diverse elements have been mixed in its melting pot, and the product is American, not English.—New Orleans Picayune.

GROSBEAKS AID AGRICULTURE.

The grosbeak is a very much maligned bird and instead of being destructive to crops he is, on the contrary, of great benefit, according to Farmers' Bulletin 456, just issued by Secretary Wilson. The bulletin states that seven kinds of finches, commonly known as the grosbeak, summer within our boundaries. A majority of these are good friends of the farmer and deserve to be widely known in order that their services may be appreciated. The grosbeaks are easily distinguished from other finches by their stout form, bright plumage, massive bills, and melodious voices. Two of them live mainly in cold, mountainous areas and have little to do with farms or with the insects that prey upon crops, and these may be dismissed without further notice. The other five live largely in agricultural regions and secure most of their food about cultivated lands. They perform invaluable service in destroying certain of our worst insect pests.

The rose breasted species is a great destroyer of the potato bug. He breeds over Kansas and the mountains of Tennessee. The investigations of the department show that the bird is fond of green peas, but invariably consumes enough injurious insects to more than offset the damage. He has become famous for his preying on the Colorado potato beetle and no less than one-tenth of the total food it consumes has been proven to be the potato beetle. It attacks the cucumber beetle. It has proven an active enemy of the Rocky Mountain locust during that insect's ruinous invasions, and among the other pests it consumes are the spring and fall cankerworms, orchard and forest tent caterpillars, tussock, gipsy, and brown tail moths, plum curculio, army worm, and chinch bug. In fact, states the bulletin, it attacks the worst enemies of agriculture.

The cardinal or redbird species ranges from southern Mexico, lower California, and Arizona, north to Iowa and Ontario, and east to the Atlantic Coast. They are permanent residents, spending the summer and winter in the same locality. It has been claimed that they pull sprouting grain, but no evidence of damage to either grain or other crops is shown from over 500 examinations. On the contrary they do much good. They feed on locusts, periodical cicada, the Colorado potato beetle, the rose chafer, cotton worm, plum or cherry scale, the zebra caterpillar of the cabbage, the cucumber beetles, billbugs, locust flea-beetle, corn-ear worm, cotton cutworm, southern figeater, codling moth, and boll weevil, and, in addition, are great consumers of injurious weed seeds.

The black-headed grosbeak hails from southern Mexico and invades North Dakota and Nebraska. It fills the same place in the West that the rosebreast does in the East. It is a foe to the worst pests of horticulture, the scale insect composing a fourth of its food.

The blue grosbeak breeds over the southern two-thirds of the United States and is greatly destructive to weevils, grasshoppers, locusts, caterpillars and worms.

The gray grosbeak inhabits Texas, Arizona and New Mexico. It is a consistent enemy of the boll weevil and cotton worm. It also consumes great quantities of harmful weed seeds.

The bulletin winds up with a plea for the protection of the grosbeak, and says: "Present investigations prove that the services of the grosbeak in destroying insect pests are invaluable. Each kind pays especial attention to certain pests which if unchecked would cause enormous loss. Few of our birds are to be credited with more good and with fewer evils than the grosbeak and none more clearly deserves protection by the practical farmer."

DISCOVERY OF THE YOSEMITE.

With stories of Indian warfare and examples of treachery of Indians filling many pages, a book recently published is sure to be read by many who like the thrilling. The book in question is "The Discovery of the Yosemite," written by L. H. Bunnell, M.D., one of the discoverers of the Yosemite Valley. Dr. Bunnell's book has passed through three editions and is now being offered in the fourth with a series of finer engravings than shown with any former edition.

Incidents leading to the discovery of the Valley are given with the story of the formation of the Mariposa Battalion, causes of the war with the Indians, and the march of the battalion into the mysterious valley. The name Yosemite, its origin, significance, and pronunciation, is given an entire chapter. The especal effort of the writer has been directed toward the placing on record of events connected only with the discovery of the Valley and the naming of many of its prominent features. He disclaims power to adequately describe its scenery.

The book is published by G. W. Gerlicher of Los Angeles and is worthy of a place in every library.

WATERPROOF GLUE FOR WOODEN DISHES.

Soak ½ pound of best glue in cold water until quite soft, melt in glue kettle. When quite dissolved, pour in 1 ounce of hot saturated solution of bichromate of potash and well stir. It is now ready for use; apply with brush. Put the article so treated to dry in full daylight for a day or two, and then apply strong alum solution. The vessel is now ready for use, but must be washed first.

The International Cotton Congress at its recent meeting in Barcelona, Spain, decided that the members of all associations affiliated with the general body should buy at least a part of their cotton on the basis of net weight, and so oblige the American planter to adopt a new system of baling and preparing cotton. It was determined to appoint a special committee to study the form for a universal contract suitable for the seller and the buyer.

STAR PORTABLE DRILLING MACHINES

They're Still Running

As steady, quiet, and even as a clock, after years of hard service, and that in every kind of place and under every condition. That affords a driller a lot of satisfaction and saves a wonderful lot of expense, time, and worry That's why

Star Portable Drilling Machines

are so universally preferred. No worry, no useless noise, no racking the machine, no vexing delays, but working all the time.

General Agriculture

COTTON CULTIVATION IN THE TRANSVAAL.

Reporting to the State Department at Washington on cotton cultivation in the Transvaal, Edwin N. Gunsaulus, United States Consul at Johannesburg, says:

"In the February number of the Agricultural Journal of the Union of South Africa considerable space is devoted to cotton growing in the Transvaal, an industry which for some time has been receiving the close attention of those in charge of the cotton division of the Agricultural Department of the Union.

"That the Transvaal possesses large areas of land especially well suited to the production of cotton is an accepted fact, and experts have devoted considerable time in efforts to induce farmers whose lands are situated in those parts of the country where favorable soil and climatic conditions exist to give the plant a fair trial. These efforts, it seems, have been attended with no small measure of success.

"Prizes for Transvaal grown cotton were offered by the Witwatersrand Agricultural Society at its annual exhibition held in Johannesburg in April and May, 1910, and many growers competed. The samples were sent to England and were judged by the British Cotton Growing Association, the first prize being awarded to a farmer in the Zoutpansberg district. All of the samples were favorably commented upon by experts in the center of the cotton manufactories of the world.

"A yield test made with one of the varieties (Bancroft) of last season's crop at the Rustenberg Experiment Station showed forty-three bolls to the pound. This is considered very good when it is remembered that until this season no systematic experiments had ever been conducted in the Rustenberg district. The results of the experimental work at Rustenberg are regarded as proof that the cotton belts of the Transvaal extend even beyond the borders of the low veldt. This is taken to mean that the source of supply will in time prove almost unlimited, instead of being confined entirely to the low veldt, as was the general impression a few years ago.

"Results at the Barberton Experiment Station have also proved highly satisfactory. Some of these results are as follows: Yield of seed cotton per acre, Doughty Big Boll, 1,292 pounds; Black Rattlin, 1,272 pounds; Cook's Long Staple, 1,224 pounds.

"At the Tzaneen Experiment Station, in the Zoutpansberg district, the results are said to have been equally satisfactory. Next season it is proposed to produce a commercial crop of cotton of about 500 acres at this station.

"Estimating the total cost of production per acre at $9, and the value of the yield at $30, it is figured that the Transvaal cotton grower should realize a profit of $21 per acre on the crop, notwithstanding the fact that allowance must be made for the expense of shipping to England, which would be slightly higher than the cost of shipping to that country from the United States. Altogether it is conceded that the South African grower cannot hope to realize quite as much for his cotton crop as does the American grower; nevertheless it is thought that the industry, once established, will prove a commercial success.

"In order to afford a proper outlet for the products of the Zoutpansberg, which is the largest district in the Transvaal, about 360 miles of new railway construction is proposed by the government. This new line will serve what will probably prove the largest cotton belt in the Transvaal, while the railway mileage to the coast will be reduced by about 200 miles."—Market World.

A QUESTION ABOUT SUGAR.

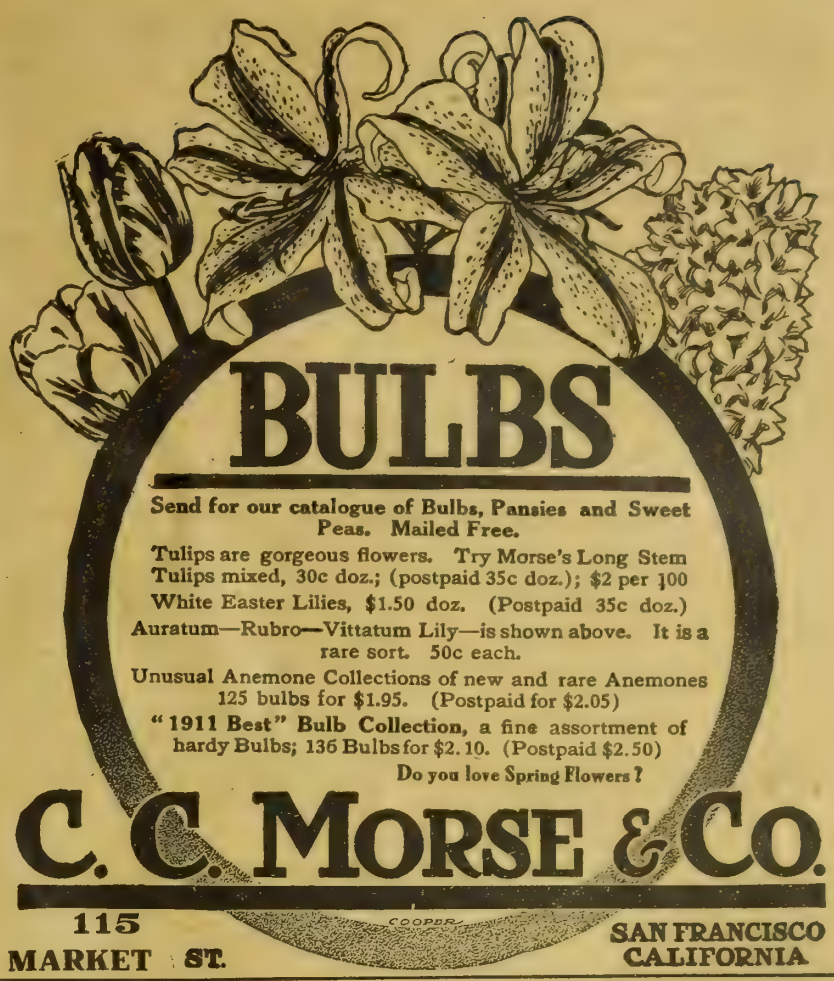
A singular notion has been put forth by an English writer in an English magazine (the Nineteenth Century) that while the English race of people are the greatest consumers of sugar in the world, they prefer to buy it from strangers, when they could make it to the greatest advantage. Even in the tropical possessions of Great Britain, where the sugar cane is a natural product, comparatively little sugar is made.

But in all the countries of the warm zones of the earth, where they were settled by the Latin races of the whites, French and Spanish peoples, the making of sugar is the chief agricultural industry. It is doubtful if any sugars would ever have been made in any part of the United States if the entire region had been settled by peoples from the British Isles. But it happened that Louisiana's first white people were French, while the Spaniards took possession of Texas and Florida, and when they learned what cane sugar was and how to make it they quickly adopted the culture of the cane and the extraction of its product, and they have kept it up despite active efforts on the part of their fellow-citizens to discourage and even to break down the industry.

The people of the United States consume sugar to the extent of ninety pounds to the head of population. The English people have about the same per capita consumption. Among the nations of Europe, Germany comes next with a consumption of between thirty and forty pounds per head. England, then, is by far the biggest sugar consumer in absolute quantity of all the European peoples. In 1909 England imported 1,760,157 tons of sugar, of which 292,393 tons were from the cane. Last year (1910) it imported 1,728,730 tons, of which 562,165 tons were cane sugar. The value of England's total imports in 1910 was £24,579,489, that of its beet sugar imports alone being £16,890,144.

These figures are given in face of the fact that a great part of the sugar consumed in the British Isles is made from beets in Germany and Austria, and could be made in England if the people there were willing to do it. But the wonder of any reflecting person is increased when he considers what such an industry would mean to that country. If it produced only a million tons of the year sugar consumption, which should require more than half a million acres of land permanently under the crop, three hundred factories, representing a capital of some £30,000,000, would be required to extract the sugar. These factories, built in the heart of the acres supplying their vats and pans with the sugar roots, would find work and wages for over 100,000 persons. Subsidiary industries without number would be created or stimulated by the new industry, and another 100,000 persons might thus be provided with work. At the same time a new class of agricultural laborer would be brought into being. All the profits and wages of this new big industry would be spent in the country, to the great indirect advantage of all its interests, and these million tons of home-made sugar would mean a recolonization of the depopulated shires and villages with many hundreds of thousands of newcomers settled in healthy surroundings and economic comfort. It is a question whether the country can afford to be so philanthropic as to forego such a source of industrial power and social welfare.

The inducements to naturalize the industry would in any case be powerful, but in the case of a country whose rural interests have terribly declined, and whose greatest need is to revive



BULBS

PRODUCE MARKET.—Los Angeles Market; San Francisco Market; Deciduout Market; Citrus Market; 308, 309.

MAGAZINE FOR THE ANGORAS

The Angora goat has become important enough in the Northwest that believers in the future of this animal have established the Angora Goat Breeders Journal. A great deal of mohair is being produced in the Northwest and we doubt not this specialty has become extensive enough that the journal is demanded. Special reference will be given to the milch goat as well as the Angora goat. The paper is published in Portland, Ore.

BEARING THE MARKET

Florida orange growers are in arms because of some trade papers persistently reporting an immense crop of Florida oranges for the coming season. Reports have been sent out that the output will be one million boxes in excess of last year. The growers maintain it will not exceed last year if it equals it. Some place the output at 75 per cent of last year's, and the grapefruit will be not more than half a crop. Some sections report grapefruit as 75 per cent short of last year.

HIGHER PRICES.

According to the summary of the Department of Agriculture's bureau of statistics prices paid to farmers in the United States on September 1, compared with September 1 last year, for potatoes averaged 56 per cent higher, barley 34.6 per cent higher, hay 23.1 per cent higher, oats 5.2 per cent higher, rye 3.8 per cent higher, buckwheat 1.9 per cent higher; corn .6 per cent lower, chickens 6.7 per cent lower, flax 7.5 per cent lower, butter 8.3 per cent lower, egggs 10.3 per cent lower, wheat 11.5 per cent lower, cotton 18.1 per cent lower.

KILLING OF SPARROWS

On the poultry page of this issue is an article by Mr. J. H. Davis of Petaluma in which he makes an appeal for protection against the pest which is becoming a menace to the State. It is nothing less than the English sparrow which has been a factor in most eastern states and which Californians have hoped would never cross the Rockies. But the pest is here and good and plenty in several portions of the state. Already campaigns have been organized in some sections. It was noted in Mr. Davis' article that these birds not only destroy growing crops and drive away other beneficial birds, but even steals away the food of poultry. These birds will more than double every year, from which it may be seen that they will become a veritable plague within a very few years unless some steps are taken to control them.

CO-PERATE

The value of co-operation is being proved more and more every year. It is worked more successfully with orchard fruits or with the people who grow orchard fruits than with the general farming, but with alfalfa people, lima bean people and now with sugar beet people getting into line it looks as though its benefit were being appreciated more and more. The lima bean people especially have shown its great value and the very satisfactory indication is that we note in daily papers the statement that bean buyers are "lying low." The probabilities are they find themselves unable to bully-rag the organization with a business head, and so they will endeavor to run the bluff of going into retirement until the bean growers get anxious. That policy will work with disorganized forces, but when the producers put their whole crop in the hands of one strong central organization, stampeding is not so easy.

PAID ITS WAY

On another page is a correction written by Mr. J. A. Filcher, Manager of the California State Fair. All the Cultivator formerly said in comparing the $10,000 purse offered on a single trotting event with premiums offered for fruit display was true, but Mr. Filcher calls attention to the fact that the $10,000 purse on the trotting event more than paid for itself. We realize that such events are strong drawing cards and as Mr. Filcher says, the direct percentage entrance fee proved profitable, so the implied criticism was to a certain extent unjust though unintentional. All who wish well to agriculture in this state long for an Agricultural Fair which will give due prominence to our greatest industry. The races and many of the vaudeville events attract the crowd and we still fear are given undue prominence, but at the same time we realize the management is up against financial and other problems in handling this great show.

SCRAPPING OVER WATER.

The unsettled condition of California water rights is being proven again by litigation which promises to be long and expensive, but only just started between Riverside and Redlands irrigators. The Redlands people seek to restrain the Bear Valley Company from diverting waters of Bear Creek, which is a tributary of the Santa Ana River. The Redlands people claim the right to these waters because of filings made thirty years ago; the Riverside people claim them under riparian rights. We doubt whether there will ever be laws so perfect that some litigation will not be necessary, but sure it is, California's laws are in such a condition that expensive litigation seems to be necessary to determine almost every right. The revision which was attempted several years ago failed because of fear of some old companies that their established rights might be jeopardized. It is to be hoped that the coming session of the legislature will find some way of overcoming these objections and that a more satisfactory condition of the statutes of California will be secured.

BEAUTIFY THE ROADWAYS.

Mr. Ernest Braunton, executive officer of the Los Angeles County Forestry Commission, informed us that the Los Angeles board of supervisors has granted $25,000 for the use of the board during the coming year. Something over $19,000 of this will be for the purchase of trees and their maintenance along the roadways of the county. This is, we believe, the most advanced step which any county has taken in this state, and we trust it is only the first in that county and that it will prove an inspiration to others to go and do likewise or better. The cities have been more advanced in appreciation of the commercial value of roadside beauty than have country districts. Civic Improvement societies, Chambers of Commerce and Women's Clubs have taken steps along these lines in many of the towns of the state. Some country districts have also shown great interest in the matter, but they should have better appreciation of the value of such work. This Los Angeles County appropriation is for use outside of the incorporated cities. The $19,000 will doubtless be the cause of as much more being used on the roadsides of that county. That is, where certain districts show a disposition to plant their own trees, this fund will be used to encourage it by guaranteeing best of care for the trees once they are planted. The eyes of the world are on California. Let us show that we appreciate it by a general tidying up.

BEET GROWERS ORGANIZE

Sugar beet growers of Southern California have been somewhat restive under the prices which have prevailed for sugar beets, and watching the ever increasing price of sugar they decided it was time to strike for at least a slightly increasing price of beets. Different sections have been organizing for some weeks and delegates for these local organizations met in Los Angeles on Saturday the 23rd, at which time owners or business managers of some of the sugar factories met and discussed the situation. Heretofore the price of $5.00 per ton for 15 per cent beets has prevailed, with higher and lower prices according to the sugar content. The growers have demanded a $5.50 price for 15 per cent beets with a 30-cent reduction for each per cent loss of sugar, and for 16 per cent beets $5.80, for 17 per cent $6.10, for 18 per cent $6.60. (this it will be noted is a 50c increase) for 19 per cent $7.10, for 20 per cent $7.60 and for 21 per cent beets $8.35. From this it will be seen that the price increases in a greater ratio than the sugar content. It is declared that is wise for the higher percentage of sugar makes more economical sugar production. The growers were met by the most responsible men connected with the sugar manufacture of California. Apparently they realize the justice of the growers' demand, and it is to be hoped that all that is demanded will be granted. The growers have determined not to sign contracts for next year's crop until the matter is settled. Approximately 45,000 acres are represented in the organization.

AN OPTIMISTIC VIEW

It was our pleasure to have a few moments' chat with Mr. W. S. Guilford, Director of Agriculture of the Sacramento Valley Irrigation Company of Glenn and Colusa Counties. Mr. Guilford has just finished a six weeks' automobile trip in practically all of agricultural California. It was in connection with experts of the Department of Agriculture, Messrs. Mills and Evans of Riverside, and Mr. A. H. Grubb, Consulting Agriculturist for Mr. Guilford's company. These gentlemen took this trip for the purpose of getting a general view of agricultural conditions in California and learning by actual contact with those conditions lessons which would be of value to them. The trip covered the coast counties from San Diego to San Francisco, thence inland across the Valley up to Lake Tahoe; thence back and into Nevada County and up the east side of the Sacramento Valley to its head; thence down the western side into Lake and Sonoma Counties, across the Bay and down the San Joaquin Valley and again into Southern California. Every phase of agriculture in this state was inspected. Mr. Guilford said the most interesting lesson of the great trip impressed upon the mind of each member of the party was the bright outlook for agriculture in this State. We have only the beginnings of agriculture, for there are thousands upon thousands of acres awaiting development. The degree of intelligence manifested by California farmers is such that this development will be very rapid, but as great as the intelligence is Mr. Guilford said the great and crying need in all sections was for a better grasp of the problems of soil tillage.

Agricultural News Notes of the Pacific Coast

Northern California

Butte County's rice crop is ready for the harvest.

Butte County is shipping figs to Eastern markets.

The farmers short courses begin at Davis next Monday.

The Butte County Fair opens at Chico next Tuesday.

Butte County's orange crop is a third larger than usual.

Some hops have been sold at Sacramento at 41 cents per pound.

The almond crop of the Sacramento Valley is practically all gathered.

Palermo, Butte County, reports oranges will be fully as early as usual.

Susanville, Lassen County, has an organization of good roads boosters.

The dairy animals at the Napa State Hospital are suffering from anthrax.

The bean harvest in the river district of Sutter County is nearing its end.

Serious forest fires did much damage near San Rafael, Marin County, last week.

Dairymen at Ukiah, Mendocino County, are building their first silos this season.

Sonoma County Pomona Grange held a session at Santa Rosa on Saturday the 16th.

The alfalfa meal mill at Woodland is running full capacity and turning out 40 tons daily.

A peculiar worm similar to the army worm is attacking orchards of Grass Valley, Nevada County.

A poultryman at Haywards, Alameda County, has imported some White African Guineas.

Thirty thousand acres of rich land near Alturas, Modoc County, is to be reclaimed and subdivided.

The Country Life Commission is making extensive preparations for a great day at Davis Oct. 14th.

Peach growers of Butte County are holding much of their fruit in the hopes of better prices later.

One hop farm near Wheatland, Yuba County, has paid out more than $40,000 to pickers this season.

Seven hundred beef cattle were delivered to San Francisco by a Butte County stock raiser last week.

Hop pickers on a big ranch near Chico celebrated the close of the season with a barbecue and dance.

A deputy state veterinarian has condemned several horses because of glanders at Nevada City and Downeyville.

People at Haywards, Alameda County, are in arms over the effort to "steal the game farm" and remove it to Folsom.

Farmers of Alameda County settled upon Wednesday the 20th as squirrel day and a wholesale slaughter was the result.

Governor Johnson has appointed delegates to attend the conservation congress which is being held in Kansas City this week.

The reclamation of the great Yolo Basin, near Sacramento, which has been discussed for many years, is one of the biggest projects in the state. It will involve the expenditure of about $15,000,000.

Central California

Stanislaus County is appealing for better roads.

Porterville has shipped 200,000 bags of grain this season.

The Pajaro Valley has already shipped 200 cars of apples.

The first car of grapes from Turlock was on September 15th.

Madera has formed a boosting organization in a new Chamber of Commerce.

The prune harvest of the valley is practically over and curing is in full swing.

A Selma peach grower reports an average return from his orchard of $489 per acre.

Lindsay and Lemon Cove, Tulare County, shipped 850 cars of oranges for the season.

San Jose held a Pure Food Show last week with over 150 exhibits of California pure foods.

Dinuba, Tulare County, growers are selling grapes to wineries at ten to twelve dollars per ton.

The State Fish Commission recently sent its fish distributing car to Inyo County with 180,000 trout.

A Fresno melon grower claims he has a fruit which is a cross of the watermelon and the muskmelon.

The new town of Patterson in Stanislaus County has a local paper established in the Patterson Irrigator.

Japanese grape pickers in the district around Dinuba, Tulare County, have been replaced by white laborers.

Most of the peaches have passed into the hands of the buyers, and the few remaining will command a good price.

Patterson, Stanislaus County, proposes to have a model dairy barn which will be one of the finest in the state.

The Kings County Fair, which will be held next week, gives promise of being the finest exhibition ever held in that county.

One cattle buyer claims he has shipped over $600,000 worth of cattle out of the Porterville district since the middle of April.

The Chowchilla Ranch in Madera and Merced Counties containing 110,000 acres, has been purchased for colonization purposes.

The San Joaquin Valley Exposition Association was recently organized at Fresno and will plan for an exhibit at the Panama Pacific.

A number of Stanislaus wheat producers are discussing the advisability of sending a representative to Australia to secure better wheat seed.

County Commissioner Volck of Santa Cruz County has issued a report for August giving particular attention to wooly aphis, codling moth and premature fruit dropping.

The San Joaquin Valley Table Grape Growers Association has filed a complaint with the Interstate Commerce Commission against the Southern Pacific because of alleged discrimination.

An effort to create a Wright Irrigation District to take over the system of the South Stockton-Mokelumne Ditch Company at Woodbridge, San Joaquin County, has failed because of opposition.

Southern California

Ventura County is raising a large good roads fund.

The Anaheim sugar factory is receiving beets at the rate of 25 cars daily.

Walnut growers are finding that nuts will be earlier this season than last year.

The Tri-Counties Reforestation committee will hold its next meeting at Redlands Oct. 5.

Extensive improvements are being made in the Highland Orange Growers Association packing house.

A contest is on between the irrigators of Riverside and of Redlands for flood waters of the Bear Valley.

The El Cajon Valley in San Diego County, is developing more water every week by installing of pumping plants.

The government engineers are surveying for an irrigation system for the Indians on the Yuma Indian reservation.

The Fullerton-Placentia walnut district will produce over two hundred thousand dollars worth of walnuts this season.

The celery crop at Talbert, Orange County, promises to be unusually good this year. So far no spraying has been necessary to prevent the blight.

The residents of El Cajon Valley, San Diego County, are so pleased with their annual fruit day that an effort is being made to have it a regular institution.

The beet growers of Southern California held a meeting in Los Angeles last week to discuss the matter of a co-operative organization which may be a factor in securing better prices.

Imperial Valley irrigators are discussing a new "High line canal." which shall take out its waters from the Laguna dam and through a cut in the sand hills entirely on American soil.

The fall meeting of the Claremont Pomological Club will be held in Ganesha Park, Pomona, September 25. Senator Lee C. Gates will be present and discuss the amendments to the state constitution, and it is hoped that Governor Johnson will also address the meeting.

The Citrus Association of Upland, San Bernardino County, at its recent annual meeting showed a total shipment for the season of 349,075 boxes of fruit. This is equivalent to nearly a thousand carloads, or over two hundred cars in excess of last season. The total to the growers was over a half million dollars.

County Horticultural Commissioner S. A. Pease of San Bernardino, corrects our former item in which we stated that he had 21 inspectors constantly in the field. He says: "I wish to state that I have only ten inspectors appointed in the county, and only two of these devote their whole time to the work. Outside of these we employ a number of field inspectors during the fumigation season to plat orchards, locating trees infected with red or yellow scale where the infection is scattering. And I may add that our fumigating season is practically from September 1st to January 1st of each season."

The Coast

Idaho prune drying plants are working overtime.

A large Angora goat farm will be established at Maxim, Ore.

The 1911 grain crop at Sheridan, Oregon, is the largest ever.

Hundreds of acres of walnuts have been planted near Canby, Oregon.

The farms of Oregon will produce $100,000,000 in farm products this year.

Hundreds of acres will be planted to walnuts during the coming season at Canby, Ore.

An apple grower near Medford, Oregon, has just sold his crop of Wealthy apples for $1,000.

The Olympic Peninsula Fair Association held its first annual fair at Port Townsend last week.

A Prescott, Ariz., farmer has found sorghum to be an excellent aid in wiping out Johnson grass.

Experts from the department of agriculture are examining as to potash deposits in Lake County, Ore.

The public service commission of Washington has established standards governing the grading of hay.

Hop growers at Chehalis, Wash., report excellent crop and of course the prices are all that could be desired.

Wenatchee, Washington, is shipping thirty cars of peaches daily. They are netting growers about fifty cents a box.

September 16th saw the greatest amount of wheat change hands in Walla Walla, 75,000 bushels being sold that day.

A movement is on foot to establish the Pacific highway to extend from British Columbia to the Mexican line at Tia Juana.

Sheep men at Lacrosse, Wash., are complaining because of heavy losses from sheep being poisoned by weeds on the ranges.

The Inter-State Commerce Commission is hearing complaint as to the rate on wool from points in New Mexico and Arizona.

The peach crop of Davenport, Wash., has practically all been harvested, the growers receiving from 50 to 60 cents per box.

One cranberry grower near Raymond, Washington, netted $889 from an acre and a quarter of worthless tidelands this season.

There are 200,000 acres of irrigable land on the Yakima Indian reservation in Washington, but as yet only 45,000 acres are under the ditch

Government officials having charge of the ranges near Klamath Falls, Oregon, have ruled that mangy or diseased stock cannot be pastured on reserve.

The reclamation of 100,000 acres of swamp land in Bonner County, Washington, has just begun. It will only cost about ten dollars an acre and will be an extremely valuable tract of land.

The bee season, according to the Southeastern Idaho Beekeepers Association, has been an extraordinarily good one. There will be about 300 tons of extracted honey for the market this year, the greater part of which will go to Ohio.

Bulbs for Fall Planting

Our importation of Dutch Bulbs has arrived. This stock is the very best and our prices are low. Come and see the display or send for free Catalog at once. Also for our large Seed Catalog, if you haven't one.

Egg-More

The biggest egg producing food made. Not merely a strong tonic, which is not advisable to be fed regularly, but a FOOD, highly concentrated and very rich in protein. EGG-MORE mixed in proportion of one pound to 6 lbs. of good ground grain feed will keep the fowls in good health, maintain a strong and vigorous system, make the hen molt early, feather out quickly and convert the protein into eggs. It has been doing just that for six years, and each year the sales have greatly increased. It is the biggest selling poultry food on the market today. 4 lb. package, 35c; 12½ lb. sack, 90c; 25 lbs., $1.65; 50 lbs., $3.00; 100 lbs., $5.50. We pay freight within 200 miles on sack of 25 lbs. or over. Send for EGG-MORE BOOKLET.

Profit in the Poultry Yard

Practical poultry people who may have ideas from their experience as to methods of feeding and housing and general care of poultry will confer a favor upon the Cultivator and its circle of readers by sending in concise accounts. Mrs. Basley is always willing to answer queries, which with the experience of others should make this a most valuable feature in poultry life on the Coast. Opinions or matters of a personal nature should be omitted, but a concise statement of facts is always valuable.

POULTRY IN CALIFORNIA.

By Mrs. A. Basley.

Poultry ranches in California, when properly managed, pay well, quite as well as in the East. Formerly it was reported that fowls could not be profitably raised here and when I first came to California, a good many years ago, I learned that the roup was very prevalent and that most of the poultry and eggs had to be shipped here from the East. It was not long before I proved to my own satisfaction, being a practical poultry raiser, that this is an ideal climate for poultry of all kinds, and that it is also an ideal climate for lice and all vermin that prey upon poultry, and that the only difficulty in the way of making a profit in the poultry business is the insect pests of the poultry yard. Successfully fight these and all difficulties will vanish.

Ideal Climate.

The next discovery I made was that even in this ideal climate, if I sat in a draft, especially a small draft, that I got neuralgia, face ache or ear ache, or at any rate a cold. I had lived in the Middle West and there was accustomed to sit or even sleep in a draft and could scarcely realize that in this ideal climate there was a danger in it. I quickly discovered that a draft had the same effect on my hens, giving them ear ache, swelled head, catarrh, sore throat or roup as it was all called, and that if I protected them from drafts and kept them clear of vermin that this was indeed the ideal climate for poultry.

Not only is the climate favorable, ideal we may say, for chicken raising, it is also ideal for turkeys, ducks, geese, etc. There are many large ranches of all of these in California, while in Oregon, pheasant raising is proving most profitable.

Thanksgiving Bird.

Turkey ranches are greatly on the increase in California. This industry has been strongly advocated by the writer, and of recent years ranches numbering from fifteen hundred to three thousand turkeys, have proved successful and valuable. In fact, we anticipate before long supplying the "effete East" with the "Thanksgiving Bird."

There are a number of duck ranches in California but not so many as in the vicinity of New York. One, however, near San Francisco, I might mention, where one hundred and twelve thousand ducklings are annually sent to market. These are sold for eighty-five cents apiece, at the age of six weeks. Need I say that the owner of this ranch finds that the duck business pays?

Expense.

The cost of keeping poultry is higher in California than in the eastern states, but as the price of eggs and market poultry far exceeds the price paid in the East, this more than counterbalances the slight extra price of the food. I found that it averages me here ten cents per month per head. One poultry breeder, who has about three thousand hens, assures me that it costs him about seven cents a month. He buys the food in large quantities and gets it cheaper than the small rancher could do. The owners of other poultry plants put the cost of food per hen all the way from ten to twenty cents per month. One lady who recently came from Ohio said the food is dearer here, it is twenty cents a sack more than in Ohio, but the eggs here are twenty-two cents a dozen more than there, so one dozen eggs more than pays the difference on a whole sack of wheat.

Pests.

The difficulties to contend with are as I have said, the insect pests and the drafts. Of course, pure water and shade as well as sunshine must be accessible at all times. Green food is also in some places one of the difficulties. This of course must be supplied.

The climate is most favorable for chicken culture as proved at the poultry shows. The fowls raised in California winning the blue in hotly contested competition with the eastern fowls.

In Our Favor.

There are not so many failures now that people understand the climate and have learned either by instruction through the University poultry courses or the University institutes or their own experience how to handle fowls. These are much more easily raised than in the East, for we have not the terrible winters to contend with and the cause of failure lies with the individual owner and not with the climate and certainly not with the good little hen, for she will always do her duty.

It's Up to You.

If you are a successful business man in almost any business you will most probably succeed; if you are a failure in any business you will prove equally unlucky in the chicken business. The chicken business is made up of little things and can easily be ruined by little things (vide the lice). The man or woman who attends to the little details, watches for the little cracks that make little drafts, fights the little pests, takes the right care of the little chicks, is the one that succeeds. A woman that is a good housekeeper usually makes a good hen mother. Whether you would succeed in the poultry business rests with yourself.

THE CURSE OF SPARROWS.

By J. H. Davis.

The mistaken but well-meaning person who introduced sparrows into this country without any knowledge of their destructive and expensive tendencies, may have done so, and perhaps did so, by taking the word of others that these rapacious birds would prove a blessing as insect destroyers. Nothing so bad ever happened to this country as the introduction of the English sparrows, unless it be war and pestilence.

These birds cost the people of the United States millions of dollars every year in seeds and grain destroyed and eaten. And no people have suffered more than poultrymen. It costs a lot of money to feed thousands of birds. In my experience I've had to stand in my yards and keep watch over the fowls until they were through with the grain feed, as the sparrows swooped down in large droves and in a little while would clean up the grain, leaving the chickens to go hungry. The block where I am now living contains three houses, my own and those of two neighbors. We all keep fowls. And it is safe to say that no less than five hundred sparrows flock down into the chicken yards at every feeding time, when the yards are not watched. They seem to know when feeding time comes, and are always on hand at the hour. In order to test the thing, a few days ago I gave my fowls an extra large feed of wheat, cracked corn and oats, and then went into the house and took up a position near a window where I could watch the sparrows. I had no more than got into the house than an immense flock of the birds visited the chicken yards and would actually

fight with the fowls for feed. In ten minutes the sparrows began to fly away, and going out I found that every grain I had thrown on the ground had disappeared.

And that sort of work is expensive, and unless the fowls are fed inside of a closely screened enclosure they get the feed every time. Wire netting they will go through unless it be the finest. I tried feeding my fowls in the poultry house, but, having a large window or opening covered with two-inch wire mesh, the sparrows went right through and into the house. And they even go in at the small entrance and exit for the fowls, as I keep the house closed all the time, with wire mesh at the open front. I now see that I must replace the two-inch mesh with inch-mesh, which is some expense.

Not only are the sparrows destructive of grain and all kinds of seeds, but they have nearly depopulated parts of the United States of song birds, for they destroy every nest of song birds they can find. Lettuce seeds, sunflower seeds and all other kinds of seeds are destroyed by these rapacious rascals. At one time I lost half an acre of Kaffir corn which I had planted for my fowls. I did not get a single grain. The same year they also destroyed all my lettuce seed, sunflowers and so on. Shooting at them did no good. Then I made scarecrows, imitation men with hats on. But this did not scare them, as they would come into the Kaffir corn patch and light on the scarecrows. So at last I gave up. I tried poisoning them, but they would not take the bait.

In some states bounties are given by the different counties and by the state for sparrow heads. And it must come to this in California. When I first came to California there were no sparrows that I saw. Yet now there are millions, and they are more than doubling every year, and getting to be worse than the rabbits in Australia. Something must be done, and done at once. Towns and communities should offer a premium on sparrows, and they should be destroyed by every possible means. Poison—grain soaked in poison and put where fowls could not get it—might be effective. And they might be netted as quails and pigeons were netted. If there were a bounty attached to their killing, there are plenty of boys and men who would like the sport.

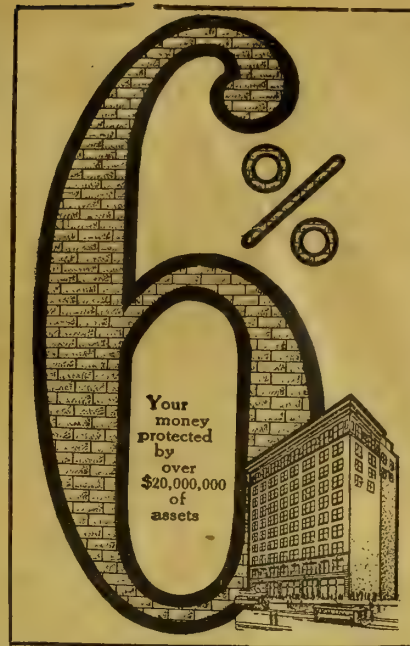
And when the next California legislature meets there should be something done by the legislature looking to the destruction of these miserable pests. There should be days set apart for sparrow killing, and then everybody should help in the killing or be made to contribute something toward the killing.

I know that in Fresno County the sparrows and the blackbirds did untold damage. At a ranch on the Kings River, where I was visiting for a few weeks, I was told that the sparrows and blackbirds and some other birds had destroyed immense quantities of gyp corn and other grain. One field of millet was entirely taken by the birds. One rancher told me that the birds had destroyed a field of gyp corn for him two years in succession, and that he was afraid to try it again. And all over the grant lands the birds had committed great havoc.

On this bird question people seem to be asleep, apathetic. But on the question of rats, which are not half as bad as the birds, a war has been waged and hundreds of thousands of dollars spent in trying to exterminate the rats, which are supposed to breed fleas and the plague.

This is a really serious matter, and deserves serious thought. That our song birds should be destroyed by the sparrows, and that millions of dollars worth of grain and seeds should also be destroyed in this manner, is no trifling matter. We are quick to fight other plagues and diseases, and why not fight the sparrow plague?

Every agricultural journal, every poultry journal, every weekly paper in the state, should agitate this sparrow question. It is a grievous burden on the people. It is costing the poultrymen of California thousands of dollars annually. And if they are not destroyed and driven out, California will not long hence have no song birds, just like some other states in the East where the sparrows have about exterminated them.—Petaluma Poultry Journal.



Our securities are backed by assets of over $20,000,000, consisting largely of real estate in the city of Oakland.

The Realty Syndicate has been established for 16 years and during this long period has enjoyed the confidence of the people of California.

In buying "Syndicate Sixes" you buy direct from the Company—you deal with the officers of the Company.

Questions and Answers

THE EDITOR AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Experiment Station Bulletins.

Where can I get Bulletin No. 214 written by Professor Quayle?—Subscriber, Lakeside.

Write State Agricultural Experiment Station, Berkeley, Cal.

Drying Prunes.

In an answer to a query on Sept. 7th the Cultivator erred in stating the proportion of water and lye to be one pound of lye to ten gallons of water. This should have been twenty gallons. A subscriber near Healdsburg writes that in that section they use as weak a solution as 1-50. For such a weak solution as that we should imagine the prunes would have to be especially green.

Cream of Tartar.

Can you inform me as to the process of making cream of tartar? Is there any demand for the crude crystals formed in grape juice?—Subscriber, Los Angeles.

We believe our inquirer must be mistaken as to formation of crystals of cream of tartar in grape juice, unless he means during fermentation. These crystals are not formed excepting from fermentation. The cream of tartar crystals are the result of the sugar in the grape juice being destroyed during alcoholic fermentation. These crystals are soluble in the sugar solution but insoluble in alcohol, hence their formation. In the manufacture of wine these crystals are formed on the sides of the casks and containers. They are gathered and shipped to this country in great quantities, sometimes importations reaching thirty million pounds. The amount produced in the United States is very small. As the labor in Europe is so much cheaper the importation places them on the market lower than they can be collected. We do not know of any place where these crystals can be disposed of, but assume that the larger eastern chemical houses would be the only place. We think there is no place in this state where they can be disposed of.

Rheumatism.

I have a turkey that picks her feet. They are swollen and sometimes so sore she can hardly walk. I have looked but cannot find anything in them. I have tried coal oil and axle grease and salve; also I tried wrapping them up, but nothing seems to do any good.—Mrs. M. J. M.

From the symptoms you give I think that your turkey has rheumatism or else "scabies." In any case mix the following and bathe the feet twice a day, but do not wrap them up with this lotion. Mix one cup of vinegar with one cup of turpentine, add saltpeter all it will take up (about two heaping tablespoons). Keep the mixture in a bottle and shake before using. This lotion will take the pain and inflammation out of the foot. Give the turkey Epsom salts in the drinking water. A teaspoon to a quart of water. Or better still, 15 grains of iodide of potassium to every quart of water. Or even bicarbonate of soda a teaspoon to every quart of water. Also give plenty of green food such as lettuce and cabbage.—Mrs. A. B.

Fertilization for Onions.

What kind of fertilizer should I use in the production of onions on a light gravelly soil? — Subscriber, Santa Maria.

If it is intended to attempt the growing of onions for market on such soil, I do not think any amount of fertilizer will make it a profitable venture. Onions require a rich, fine, loamy soil containing a large amount of humus, in order to secure a crop that will pay. And if the light gravelly soil has been raising hay it will be still more unfitted for onions. However, if inquirer wishes to risk it, any high grade fertilizer with a large percentage of potash would be the best. And better results will be had from growing the onions in a seedbed and transplanting into open field when they get of proper size than by sowing the seed at once in the open field. The latter method often produces half the crop thick necks and half of inferior quality.—Q. A. L.

"Buy the Best Milk Producer in the world, sugar beet pulp at 50 cents per ton, of Los Alamitos Sugar factory."

Curing Olives.

Please give formula for putting up olives.—Subscriber, Santa Ana.

We take it the subscriber wishes information as to pickling olives. Full instructions for the handling of olives is given in the issue of Sept. 15, 1910. It was written by Mrs. Sherman and is considered one of the very best formulae ever given.

Planting Lawn.

What is the best month in the year for planting a lawn?—Subscriber, Glendora.

See answer to similar question in last week's Cultivator.

Red Spider.

I enclose branch of almond tree infested with insects. What are they, and what is the remedy Another tree adjoining does not seem to be infested.—Subscriber. Orange.

There is no insect which we can find on the leaves which have been sent, but there are marks of the work of the red spider. We presume that is the cause of our subscriber's trouble. The treatment is given in the Cultivator of Nov. 3, 1910.

Shire Registration Book.

What is the address of the Shire Registration Association of America? —Subscriber, Napa.

Charles Burgess is secretary. His addres is Wenona, Ill.

Chicken Pox.

A disease has broken out in our flock of chicks. Sores break out on the heads of chicks. in some cases covering the eyes. then the chick goes blind and soon dies. Where not so badly affected, some get well. The eruption looks like a black wart, and if the chick gets well, where the scab was it leaves a pit like a smallpox pit. We think it is chicken pox. Can you give a remedy? None of the grown fowls are affected.—Rancher.

The disease is chicken pox. The cure is to grease the little warts with carbolic salve and add a little sulphur to the feed. Chicken pox is a germ disease and is very prevalent in the fall in California. It is much worse in the East. It is not fatal with the adult fowls, although it retards laying, but is fatal with little chicks, and even with those half grown. The only thing you can do is to grease the spots as soon as they appear with carbolic salve or carbolated vaseline, or you can make a good salve by mixing in one tablespoonful of lard four drops of the crystallized carbolic acid. The carbolic acid kills the germ. Some advise using bluestone (sulphate of copper), washing the sores with warm suds to soften the scabs, and afterwards bathing the spots with a solution of sulphate of copper one-half a dram (one-half a teaspoonful) in a pint of water. I have found the carbolic salve quite satisfactory. It should be carefully applied and only to the spots, as it is a poison, and if smeared over the chieck poison, and if smeared over the chick en pox is very contagious. The houses and coops should be thoroughly disinfected by spraying with a two per cent solution of carbolic acid or whitewashing freely with carbolic acid added. Segregate the affected chicks and examine for lice and mites, as these pests carry the infection to others.—Mrs. A. B.

Irrigation and Forestry

REQUIREMENTS OF SETTLERS ON RECLAMATION LANDS.

Complaints have been received from settlers on Reclamation projects that by reason of the misrepresentations of land agents they have been induced to purchase lands which were afterwards found to be without any rights to water from the Government canals. The Secretary of the Interior today issued the following warning which, while it refers particularly to the Rio Grande Project in New Mexico and Texas, is equally applicable to other projects containing large areas of private lands:

"All persons are warned against accepting any statements concerning this project, without inquiry from the officers of the Reclamation Service. Experience has shown that some warning of this kind is necessary because misleading statements have been issued regarding the project and the conditions existing upon it. The project has many advantages and would not have been taken up and pushed unless it was considered feasible and worthy of development. These facts, however, do not warrant certain exaggerated statements which have been made.

"In particular, attention is directed to the requirements of the Reclamation Act regarding residence and cultivation. The act prescribes that no right to the use of water for land in private ownership shall be sold for a tract exceeding 160 acres to any one landowner, and that no such sale shall be made to any landowner unless he be an actual bona fide resident on such land or occupant thereof, residing in the neighborhood of said land.

"It is also required that the landowner shall reclaim at least one-half of the total irrigable area of his land for agricultural purposes before any right to the use of water shall permanently attach. Ignorance of these and similar requirements has resulted in great embarrassment to purchasers.

"It is not known how many years will be required for the construction of the storage dam, nor is it safe to make predictions as to when water will be available in view of the many uncertainties existing.

"Warning is also given that the amount of available water power has been grossly exaggerated in many current discussions. It is not definitely known that there will be any power available for sale, and there is no assurance that it will produce dividends reducing the cost of water rights.

"Purchasers are warned against being misled by the statement that certain tracts are 'signed up' under the government irrigation project. This 'signing up' is the landowner's subscription to the water users' association. It designates tracts of land and subjects to liability for water charges so much thereof as shall hereafter be furnished with water from the government works, but it does not in any way bind the government to furnish water to any particular tract. On the contrary, considerable areas have been thus designated in subscriptions to which, because of location, elevation, physical conditions, or other reasons, water can never be furnished. Prospective purchasers should not rely upon the statement that land is 'signed up,' but should carefully investigate and satisfy themselves that the tracts offered to them are in fact likely to be furnished with water under the project.

"While it is not possible to give definite assurance on many of these points, the persons interested are advised to read carefully the terms of the Reclamation Act or consult the publications such as "Questions and Answers" which have been prepared to explain some of the requirements of the law."

CONTROL OF RESERVES.

The decisions handed down by the Supreme Court on May 1, concerning the right of the government to control grazing on the national forests are of great interest to western people, and especially to the western stockmen. The right of the government to control its own lands within the various states and territories is so clearly defined that it is regarded by Secretary Wilson as establishing absolutely the position these lands occupy under the law. "I am very sure," said Secretary Wilson today, "that the stockmen of the West, as well as the western people generally, will accept this decision of the Supreme Court at its full worth and that the controversy which has heretofore existed regarding the right to use the grazing lands within the various national forests without permit from the Department of Agriculture will be brought to an end.

"The two cases decided were the so-called Light case, which originated in Colorado, and the case of the United States against Grimaud, Carajous and Inda, three California stockmen. In the Light case one of the principal issues joined was on the question whether the fence law of the state must be complied with in order that the United States might sustain action for trespass on the national forests. The California case concerned the question whether violation of the national forest regulations is punishable as a crime.

"Light is a Colorado stockman who, in 1906, turned his cattle loose on public land adjacent to the Holy Cross National Forest in such a way that they would naturally drift upon national forest lands. Mr. Light refused to take any steps to prevent this and also refused to take out a grazing permit. It was maintained by Light's lawyers that, inasmuch as the laws of Colorado do not allow a private person any remedy against owners of stock which stray upon his land unless the land is fenced, the government is without redress. An injunction was secured from the eastern court requiring Mr. Light so to handle his stock as to prevent them from trespassing upon the national forest. Mr. Light, however, refused to do this and, with the backing of other stockmen of his state and, eventually, of the state of Colorado itself, which made a special appropriation for the purpose, carried the case up to the Supreme Court for final decision.

"In the effort to establish the contention that the government was wrong, not only the validity of the grazing regulations but the constitutionality of the entire national forest policy was challenged on every ground which the counsel representing the stock interests and the state were able to raise. The fact that their contentions were, one after the other, set aside by clear-cut statements of the law is a matter of extreme satisfaction to me. I nevertheless believe that the stockmen who have so vigorously contested the government's position will feel that they have been fairly dealt with both by the department and the courts.

"In the second case, known as the Grimaud case, the contention of the stockmen was that the act of congress, under which the Secretary of Agriculture is authorized to make regulations for the national forests, was unconstitutional in so far as it delegated to the Secretary of Agriculture the power to make rules and regulations and made a violation thereof a penal offense. The unanimous decision of the case is exceptionally clear-cut and final. The power of congress to authorize the Secretary to establish such regulations for the administration of these forests is absolute, the court holding that congress had the full power to authorize the Secretary to make these regulations and enforce them. The punishment was fixed by congress and the Secretary's regulations merely provided the methods of enforcing the law and, in the event of its violation, of applying the penalty fixed by the law. As the court in its decision says, the Secretary is authorized 'to regulate the occupancy and use and to preserve the forests from destruction.' A violation of reasonable rules regulating the use and occupancy of the property is made a crime, not by the Secretary, but by congress. The statute, not the Secretary, fixes the penalty."

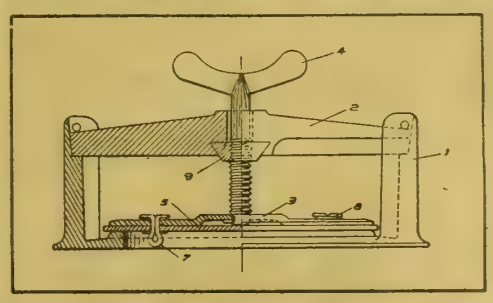
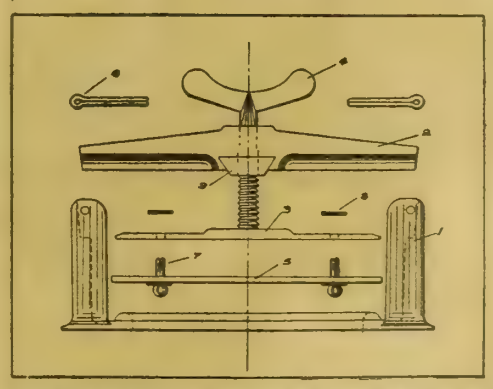
POMONA CIRCULAR VALVE





THE main object of the Pomona Valve is to construct a very cheap and simple valve, and one that requires no special tools or wrenches or experience to operate.

The Pomona Valve is constructed with non-corrosive parts, thus insuring a workable valve regardless of infrequent use. All fastening held in place by cotter pins, thereby making a very cheaply constructed valve and yet a very substantial one.

SEEDS AND PLANTS

Wanted—10,000 Citrus Trifoliata stock for budding. Please state age, size and price. Montarioso Nursery, Box 1500, Santa Barbara, Cal.

WELL MADE.

The writer on a recent visit to Fresno visited the shops of The Fresno Implement Company, partly, it must be confessed, in search of advertising "copy," but more to see their new spring bolster wagon in course of construction. There is nothing particularly different about this wagon as compared with other gears, except that the bolsters, instead of being made rigid as has always been done in the past, are built up of leaves of 3x 5-16-inch spring steel. The rest of the gear is standard, it having the regular height of wheel, width of track, and distance between bolster standards. The advantages of this spring bolster construction, which they tell us is fully covered by patents, are easily apparent to any one. The writer was especially struck, however, by the guarantee under which this wagon is sold—it being, without question, the broadest guarantee that has ever been offered. For example, they guarantee the tires against coming loose for three years. They also agree that if the axle is bent or broken under any load, on any road, at any time, they will, on return of bent or broken part, furnish a new one without charge. They also guarantee the gear against defective workmanship.

After going through their shop, however, and noting the way in which every piece that enters into this wagon is tested and inspected, it is very easy to see how they can back up their wagon in this way.

We have no doubt but that this gear will prove to be a winner, and we advise such of our readers as expect to purchase a wagon in the near future to write to them for an illustrated booklet, which fully describes the construction of this gear.

PLANTING TREES WITH DYNAMITE.

Tree planting with dynamite is the title of a book issued by the DuPont Powder Company, and gives much that is new and valuable in the fitting of ground for planting of orchard trees. The book states that it has been conclusively proven that dynamite is an exceedingly valuable addition in the successful growing of trees, and that those who have tried it are convinced that no method of excavation is so economical, quick or productive of desirable after results as blasting with dynamite. Many illustrations are given in the book showing conditions of trees planted in dynamited holes, and of others with much less thrifty growth planted in holes as ordinarily excavated. Instructions regarding the handling of dynamite and many letters of recommendation are given in the Book. We doubt not it may be had for the asking by writing the E. I. du Pont Powder Company, Wilmington, Del.

FALL CATALOGUE.

The Morris & Snow Seed Co. of 425 S. Main street, Los Angeles, is sending out its 1911 bulb and tuberous rooted plant catalogue. It contains cultural directions for bulb planting in California and a long descriptive list of the various bulbs. The catalogue is not large; in fact, just about right for the pocket, but full of valuable information.

She (complainingly)—"You promised faithfully that you wouldn't smoke any more after January 1."

He—"I'm not. I am simply keeping up the usual amount."

Milk Coolers, all sizes and prices. Guy F. Kelsey & Co., 106 East Eighth St., Los Angeles, Cal.

Veterinary

Answers in this column by Fred G. Matthews, M. S., D. V. M., 1232 Central Ave., Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Throat Trouble—Tuberculin Test.

About six weeks ago my cow lost her voice and began to cough. She has lost some flesh, but her appetite is good and the flow of milk continues about the same as before the trouble began. There is broncho grass in the pastures. Would the beard from grass lodging in the throat or windpipe cause the trouble? What are the symptoms of tuberculosis and where may tuberculin for testing the cow, be procured?—Subscriber, Plymouth.

Beards from hay and grasses often lodge in the throats of horses and cows and may result in more or less injury to the vocal organs. The symptoms of tubereulosis vary greatly according to the location and extent of the diseased areas. The internal organs may be extensively involved without marked external evidences. When located in the udder it asumes the form of chronic garget; when some bone is affected there is obscure lameness; when confined to the lungs and throat there is modified breathing and coughing, etc. Your druggist can secure tuberculin from The Cutter Laboratory, Berkeley.

Instructions for applying the test will be furnished with the tuberculin if requested. Temperature may be taken—per rectum—with a clinical thermometer for human uses. Select a thermometer with a blunt and rounded mercury end to avoid the danger of pricking the parts while it is being inserted. If the services of a qualified veterinarian are not available get your physician to aid you in making the test.

NOVEL DEMONSTRATION.

A spraying-outfit-chug-chug-wagon combination may give the impression that the world is moving still faster. We have no record of any installed on either monoplanes or biplanes, but the illustration given here shows the chug wagon combination all right.

Swell Spraying Outfit Which Will Visit Orchards.

This is in fact the demonstrating outfit of the Bean Spray Pump Company of San Jose. This magnificent machine is installed on the automobile and is now touring California. This coming week it will be in Los Angeles and other portions of Southern California. Everyone interested in the most up to date spraying appliances should get in touch with the manager of this outfit, and he will visit any portion of Southern California within reasonable reach of Los Angeles and show up the merits of the machine. Mr. Crummey, the manager, tells us this auto wagon, which weighs 6,400 pounds, has one of the complete Bean Giant Sprayers, a complete Pony Power Sprayer, excepting that the tanks are very small. Hand pumps are also a factor with the outfit. Wherever this demonstrating outfit has appeared most intense interest has been manifested. Santa Barbara and Santa Paula sections observed its workings. Orchardists in any section should write at once to Mr. Floyd Hanson, care of Cultivator Publishing Company, 115½ North Broadway, or we doubt not Mr. Hanson can be seen at the Hollenbeck Hotel. Send in the requests for the demonstration.

Anthrax Cure, Milk Fever Outfits. See G. J. Weber Co., 225-227-229-231 East Sixth Street, Los Angeles.

FOURTH TIME SEA TO SEA.

Not content with having successfully completed a record breaking motorcycle trip across the continent from San Francisco to New York, Volney E. Davis is now motorcycling back to San Francisco.

This is not his first, but his fourth, transcontinental tour, and Davis is the only motorcycle rider with a round trip from San Francisco to New York to his credit. He rode the 3,746 miles from the western to the eastern coast in twenty days, nine hours and one minute. He has now passed Toledo on his way back—and "going some."

Legal

Edw. L. Payne, attorney, 301-304 Douglas Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Payne is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

A Nuisance.

A neighbor maintains a bull in unmolested view in corral immediately opposite residence. Is there any way this may be prevented?—Subscriber.

The civil code declares that anything which is indecent or offensive to the senses, so as to interfere with the comfortable enjoyment of life or property, is a nuisance. The penal code uses the same language. The thing complained of seems to be a private as well as a public nuisance, therefore the inquirer might proceed to bring an action to have the nuisance abated under the provisions of the civil code, or he might bring the matter to the attention of the district attorney and request him to proceed under the provisions in the penal code. No doubt a judge or jury entertaining the ordinary American ideas of decency would consider the complaint well made.—E. L. P.

HOMESTEAD AREAS OPEN TO ENTRY.

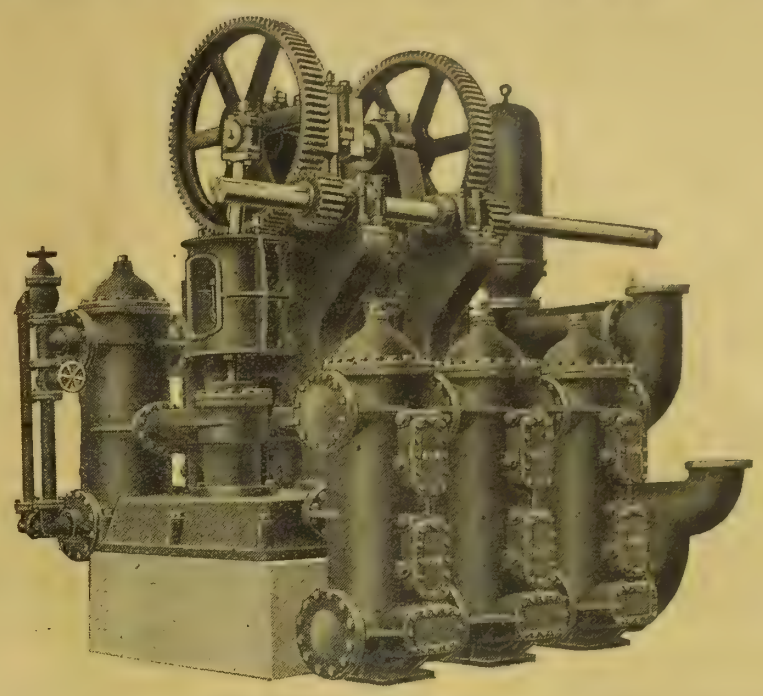
In August the United States Geological Survey passed upon and recommended for designation 23,142 acres under the enlarged homestead act. This makes a total of 190,394,927 acres of land in the public land states which have been declared enterable under this act in 320 arce tracts.

Do your cows milk hard? Send 50 cents for teat expander. O. J. Weber Co., 225-227-229-231 East Sixth St., Los Angeles, Cal.

Golden Gate Park

Is Irrigated by

DOW PUMPS



Visitors to San Francisco are always interested in those large Dutch windmills along the beach near the Cliff House.

While giving the beach a touch of beauty, these mills are saving the people of San Francisco many thousands of dollars in taxes. Down in the base of their towers are immense Dow Pumps, pumping one million gallons of water every day. This water irrigates the famous Golden Gate Park flower gardens. Dow Pumps were selected for this work because of their reliability and the large amount of water pumped with the power available.

When you start looking for a pump, remember that we make pumps for every service, and the pump suitable for your ranch will be just as reliable as the pumps in Golden Gate Park.

If you cannot visit our show rooms in Los Angeles or San Francisco, write for a copy of

OPPORTUNITY.

A craven hung upon the battle's edge,
And thought, Had I a sword of keener steel—
That blue blade that the king's son bears—but this
Blunt thing! He snapt and flung it from his hand
And, lowering, crept away and left the field.

Then came the king's son, wounded, sore, beset,
And weaponless, and saw the broken sword,
Hilt buried in the dry and trodden sand,
And ran and snatched it, and with battle shout
Lifted afresh and hewed his enemy down,
And saved a great cause that heroic day. —E. R. Sill.

AN APARTMENT HOUSE TRAGEDY.

This is the story of a young man and woman who had thought well enough of each other to get married and take chances. There is no moral attached, so if that is what you are looking for stop at this point.

They lived in an apartment house, the name of which need not be given, because the name of such a place means no more than the title of a Pullman car, and lends no greater distinction. Enough, that it was the ordinary sort of apartment house, with a hall that started to be showy and only got so far as the tawdry, and had all the modern inconveniences. There was a landlady whose hand had been calloused by the touch of coin. Her manner was artificially polite, so that when she smiled her face threatened to break and surprised you by not doing so.

There were no children in the place. That was understood. The landlady, if ever she had perpetrated any, had hidden her tracks. In the background a landlord was glimpsed occasionally, but nobody ever found out what he was for.

The roomers were for the most part unmarried — maidens still hopeful, spinsters dissembling their regret, sour bachelors. There were several very young couples, and some so elderly that such sons and daughters as might have been charged against them were out in the world.

So in all the apartment house there was no sound of childish voices, no smudge of little fingers, no romping in the halls. It was a peaceful place except when the bachelors were more crusty than usual or the feminine contingent got opportunity to rend some temporarily absent sister.

One day the man's wife told him a secret whereat he grinned broadly and then looked troubled.

"You know, my dear," he said, "that babies are not permitted in this house. It's dead against the rules."

She did know it, but thought that her baby, by getting in on the ground floor, as it were, would have exceptional rights. With this view she sought to cheer him.

After a while, in the manner of her kind, she went away to her mother's. During her absence the husband was kept informed, and one day in a burst of confidence told the landlady that he was a dad. He threw the news out as a feeler.

"Oh, too bad," said the landlady. "How very careless! And you have been such good tenants."

When a man of ordinary discernment it spoken of in the past tense he knows what has happened to him. The husband and father went forth to seek shelter for the wife and baby. Gradually there dawned upon him the conviction that parentage is taboo, that possession of a child is a banality. It hurt his feelings, and it aroused his ardor.

Some advertisements stated "No children." At these he merely hurled anathema. But many others meant "No children," the information having been omitted from print on the score of economy. He lost much time in chasing down such false clues to all the comforts of a home.

It must be acknowledged that he was treated with courtesy, although the pity blended with it annoyed him. Nobody exactly slammed the door in his face. None went so far as to kick him down the steps. He was given to understand that while in certain relations he might be a good citizen, the guilt of fatherhood was upon him, and he had become an impossible person.

At first this filled him with resentful ire, but at last his spirit was broken. He assumed a hunted look. He wondered vaguely if any landlady in the universe ever had had a baby, and if so, where she had sequestered it during the years it was unfit for human association. His mind could not stretch to imagining that a landlady might at one time have been a baby herself.

One day he sought an apartment house that had a friendly look. There were good rooms and reasonable prices.

"Madam," he said after the inspection, "I like your rooms, your location, and you seem to have a kind heart. I can pay your rates. My income is assured, as I am a journalist, but there is a shadow over me and my wife. I have trod miles of pave in quest of bed and roof, and have been turned down regularly. I throw myself on your mercy."

"Anything wrong with your marriage certificate," she asked.

"Not a thing. Signed, sealed and attested. Ceremony performed by a high-class parson who stung me for $25. Groom wore conventional black. Shoes, rice—all that sort of business. We have good family records. Are not given to kleptomania, dipsomania or ragtime. Are opposed to anarchy, favor the recall even of judges, don't read Shaw. Have excellent table manners and decent clothes. Believe in the individual drinking cup, go to church sometimes, and mind our own business. I do not smoke in the bedrooms and she does not stick wads of gum on the furniture. No, we have not been leading double lives. Worse than that. We have a—may I whisper it?—We have a baby. A cute little beggar with pink toes. I am told, an extra fine boy. I am going to train him to be a journalist and have great hopes for his future."

"Good heavens," cried the landlady, "and I had almost got you to sign a lease."

With a shudder she turned away. The man stood alone. A sign, "Family Apartments," stared mockingly at him. "If only I chewed tobacco," he muttered, "it would be a pleasure to spit copiously on that flaunting lie. What is a family? A man and a woman? And by the addition of one toothless stranger it becomes an aggregation of outcasts. Faugh!"

To this comment he appended other remarks better not of record.

That night he wired his wife:

"Have a chance at a bungalow situated in a ten-acre pasture. Privilege of keeping baby, cat, dog and nurse girl if you can bribe one. If satisfied come on with youngster. If you insist on apartment, poison the kid and come alone."

He wrote this out of bitterness of soul and she, not understanding the situation, stuck him with a telegram, 40 cents collect, stating that he was a brute who didn't deserve a baby.—Henry James in L. A. Tribune.

RECIPES.

Orange Fritters.

Make a batter with one cupful of milk, two well-beaten eggs, two ounces of soft butter, a pinch of salt, and one-half pound of flour sifted with one teaspoonful of baking powder. Peel the oranges and divide into sections, removing all tough, white skin, but not breaking the thin skin of the section; mix them with the batter and drop by spoonfuls in boiling hot cooking oil, having a section of orange in each spoonful. Fry to a golden brown, drain on paper, and roll in powdered sugar.

Cranberry Puffs.

Two cupfuls of flour, four level teaspoonfuls of baking powder, one-half level teaspoonful of salt, two level

"Light Work"

There is no needless delay about putting the horses up for the night and getting into your own comfortable home when the work is lighted—and lightened—by a Rayo lantern. Rayo lanterns give such a strong, steady light you can put your hand on what you want in a second.

Rayo lanterns are the best and brightest on the market.

Made in all kinds of styles and sizes, to suit any use.

Finest material and workmanship; most light for the oil consumed; will not blow out.

All Rayo lanterns are equipped with selected Rayo globes, clear, red or green, as desired. Wicks inserted in burners, ready to light.

Dealers everywhere; or write for descriptive circular direct to any agency of the

Standard Oil Company

HARLEY-DAVIDSON

MR. FARMER

THOUSANDS of progressive farmers are buying Harley-Davidson Motorcycles this year. Buying them because they travel 10 miles for a cent, less than the wear and tear on their team and rig if they drive.

Buying them because they make any trip in one-fifth the time consumed driving.

Buying Harley-Davidsons because they have proven themselves to be the most economical machines made at any price.

The Harley-Davidson holds the World's record for economy besides innumerable speed records.

It is the only machine which has ever been awarded a 1000+5 score and the diamond medal in an endurance contest.

Nearly one-third of all the motorcycles sold in America are Harley-Davidsons. Made and guaranteed by the largest exclusive motorcycle factory in the world. Send for literature.

Mills College
NEAR OAKLAND, CALIFORNIA

The only Woman's College on the Pacific Coast. Chartered 1885. Ideal climate. Entrance and graduation requirements equivalent to those of Standford and University of California. Well equipped laboratories. Grounds comprise one hundred and fifty acres. Special care for health, out door life. Pres. Luella Clay Carson, A. M., Litt. D., LL. D. For catalogue address Secretary, Mills College P. O., Calif

tablespoonfuls of sugar, four level tablespoonfuls of butter, two eggs, one cupful of milk, one pint of cranberries. Sift together the flour, baking powder, salt and sugar; work in the shortening with the fingers, then add the eggs well beaten and mixed with the milk. Beat well, add the cranberries, and half fill buttered cups. Steam one hour in a closely-covered steamer. Serve hot, with a generous quantity of hot sweet sauce.

Sweet Potatoes.

Two large or three medium sized ones will about fill a three-pint baking dish. Boil without peeling for 15 minutes if small, or 20 minutes if large. Peel, cut in lengthwise slices about half an inch in thickness. Have two tablespoonfuls of butter melting in an earthen dish. Put in a layer of the potatoes, which sprinkle with brown sugar, dot with bits of butter, and repeat until within an inch of the top of the dish, finishing with the sugar and butter. Pour over half a cupful of hot water, cover and cook in a moderate oven for ten minutes, then remove the cover and cook for fifteen minutes longer.

Baked Rice.

This requires no egg, and is much liked when cooked just long enough so that the rice is merely held together by the liquid which has become creamy. The secret is in very slow baking. If the fireless cooker is used, reduce the quantity of milk by two cupfuls, as there is no evaporation in this way of cooking. Put three-quarters cupful of well-washed rice into a buttered baking-dish, add one-quarter cupful of sugar, a rounding tablespoonful of butter, six cupfuls of milk and a level teaspoonful of salt. Set in the oven, stir with a fork at the end of five minutes and again in five minutes more. Now cook slowly two hours or more. Serve plain or with cream and powdered sugar, or with a bit of jelly on each portion.—Country Gentleman.

HOMELY HINTS.

To remove marks and scratches on dull finished furniture steam it under wet newspapers and a hot flatiron. This must be done only if the furniture has a dull finish.

Don't dampen silk when pressing; a moderately hot iron with cloth or paper, between the garment and the iron, when the pressing is done on the right side should be used.

In dusting a room, do not fail to dust the brass or iron bed well. Remember that the head and foot pieces under the springs should be as free from dust as the parts above.

Cheese will be kept moist and free from mould if wrapped in cloth wrung out in vinegar.

Chopped pistachio nuts are delicious served with plain vanilla cream or blancmange.

If a boiled egg is fresh it will dry quickly when taken from the water.

WEIGHTS AND MEASURES.

Two tablespoonfuls of butter make one ounce.

Four tablespoonfuls of flour make one ounce.

One cup of butter packed solid equals one-half pound.

One cup of granulated sugar weighs one-half pound.

Five medium eggs without shells make one-half pound, or four with shells weigh one-half pound.

One cup of chopped meat packed solid weighs one-half pound.

One cup of milk or water is equal to one-half pound.

In nearly every recipe, unless it calls for a level measure, a tablespoonful or teaspoonful means that the substance should rise above the level as much as the spoon rounds under. To measure half a spoonful divide lengthwise of the spoon and for a quarter take half of this.—N. Dakota Farmer.

A PLACE FOR COLLARS AND BELTS.

The convenient shirt waist box is made even more useful by tacking a couple of pieces of elastic, about an inch wide, across the inside of the cover. These should be drawn very tight, and reinforced with one or two tacks in the middle of the strips, if the box is long. They make an excellent place for holding collars and belts.

Hay.

Scott, Magner & Miller say:

Arrivals of hay for the week ending today have been 3850 tons, which is about a 25 per cent decrease from arrivals for several weeks past. This decrease in arrivals is perfectly natural and expected for the reason that practically all the hay is cleaned up from the fields in the large districts which usually ship to the San Francisco markets. A large part of the hay that has come in during the last two weeks has consisted of alfalfa and low grade types of hay coming by water from the bay and river landings.

Comparatively little hay of the good qualities has been coming in; in fact, the fields have been cleaned up to such an extent that the better grades of hay will have to be taken from the warehouses now to supply the current demands. A little high-type hay from the warehouses has already been brought into the market and sold at topmost figures. In sympathy with the above conditions our market has advanced about $1.00 per ton on the choicer types of wheat hay, and the market at this time for this variety is decidedly firm with not much offering. Fancy red oat hay is freely asked for, but the warehouses must be drawn on to supply this type.

The alfalfa hay market continues unchanged. The heavy shipments that are coming in steadily have not affected the situation one way or the other. It is not expected that there will be any change in the basis of values on this article for some little time.

We quote the wholesale prices in round lots on today's market as follows, viz:

Fancy wheat hay	19.00@20.00
No. 1 wheat or wheat & oat	16.50@17.50
No. 2 wheat or wheat & Oat	13.00@14.00

Deciduous Fruit Market

Manager F. B. McKevitt of the California Fruit Distributors reports:

Sacramento, Cal., Sept. 23, 1911.

The following gives the number of cars of deciduous fruit shipped from all points in California for the week (7 days) ending Friday morning, September 22, 1911:

Peaches—223¾ cars. Salways are going forward in small volume, and will continue to do so during the next ten days. It is not likely there will be any straight cars shipped, and what few there are will nearly all go to auction.

Plums—2½ cars. No straight cars of plums are now offering, the quantity represented in this week's shipment being made up of scattering lots from various sections.

Pears—57¾ cars. The shipment of fall and winter pears is now of as large a volume as can be expected at any time during the season. It is likely that after the coming week the movement will decline rapidly.

Grapes—493½ cars. Practically the same quantity of grapes moved out this week as during the preceding one. In the Lodi district there has been a considerable curtailment in the shipment, but scattering lots from other sections have very nearly made up the difference. There are a few cars of Malagas moving, and they will continue to be offered in a limited way for some time to come if markets justify. Tokays are in ample supply from the Florin and Lodi districts; the former will practically finish shipping during the coming week. The quality of the Lodi Tokay has never been as good as at present. The fruit is well developed, has now plenty of sugar, and the color is perfect. It is safe to say that no finer grapes ever left the state of California than are available at the present time.

Weather conditions continue very favorable. There was a storm threatened on the 21st, but the clouds have rolled by and the sky is now clear.

Comparative statement of shipments up to September 16, 1911:

	1910	1911
Cherries	250½	216¼
Apricots	289¾	214½
Peaches	2445¾	1934¾
Plums	1552½	1351½
Pears	2223	2044¼
Grapes	2204½	2140¾
Sundry	6	3
Total	8972	7905

Citrus Fruit Market

LOS ANGELES, Sept 27, 1911.

The situation as to Valencias is very satisfactory, even the small off sizes, the large quantity of which have been embarrassing, are meeting with fair demand. These run, however, over 30 per cent of the total output, though quite a number have to be thrown into the auction markets.

Lemons are exceptionally strong. The demand is good and every offer is quickly picked up; $5.00 to $5.25 is readily commanded for the better grades.

Shipments.

Shipments of oranges to date since November 1st, 1910, 36,110 cars, lemons 6,398, or a total for the season of 42,508. Shipments to same date last season were 24,829 cars of oranges, 4,576 lemons, or a total for that season of 29,405.

NEW YORK, Sept. 21.—Ten cars Valencias, one car lemons sold. Market strong on both oranges and lemons. Weather fair.

WOMEN IN AGRICUTURE.

The women seem to be considering horticulture and agriculture as a most desirable calling. I have a large number of letters on hand asking me what they shall consider as a crop to start farming. Now they all want to come to California to start. It seems that California is regarded as a place where one can sit down and the sunshine will do the rest. I always say to people that the things we run after rarely turn out as well for us in a financial way as those we tumble into. The way opens to us when we really try to do anything and it is often all so different to the things we had planned. Now why are these women considering coming to California? Are our men more kindly? I do not think so. I think the women must hang back from mingling in the management of the farm back East. I have before me a picture of forty-seven well-fed men, who recently formed the Illinois Alfalfa Growers association, not a woman in the picture. Surely some of the widows and spinsters do grow alfalfa in Illinois. I know out in California we women would not have let the men form that association without us.—M. E. Sherman.

FARMERS NATIONAL CONGRESS.

The Farmers National Congress, a pioneer national agricultural body, was organized to voice by resolution the wishes of the farmers of the country on questions related to agriculture.

The membership of the Congress is composed of delegates from each state appointed preferably by the governors of the respective states, but should a governor for any reason fail or refuse to make appointments, a certificate of appointment by the secretary of the state board of agriculture or state agricultural society, or by the state vice president of the Congress, is sufficient. The number of delegates from each state is unlimited.

The Farmers National Congress aims to confine its discussions and resolutions to broad national problems. Local issues are avoided, and speakers are expected to discuss national subjects in a broad national manner. The Congress is non-partisan, but is free to take up any politico-economic or other question of importance to agriculture.

The Congress has been of material service in securing much valuable legislation for the agricultural interests of the country.

STOP! LOOK! LISTEN!

FREE.—The Largest Book of Its Kind Ever Printed

64 PAGES—EVERY BREED ILLUSTRATED

and many other interesting pictures taken from life in and around Southern California. This book is the largest and most expensive ever printed by any concern whatsoever on baby chicks, hatching, etc., etc. Tells the prices of every breed of chicken, turkey, goose, etc., that we offer for sale. Tells how we ship thousands and thousands of baby chicks safely year after year, and gives full details on the raising of baby chicks, hens, etc. Articles on every part of the chicken business are given, and it won't cost you but ONE CENT—just a post card—saying you want it.

Laying hens, PULLETS, COCKS, COCKERELS, BABY CHICKS, HATCHING EGGS, COLONY HOUSES, INCUBATORS, BROODERS, etc. Investigate—that is all we ask. Send today. We mail at once. Send the names of anyone near you that is interested in poultry. We will be glad to mail the books.

Articles under each of the following heads: "Color of Baby Chicks," "Thoroughbreds," "Poultry Pays," "Does It Pay to Buy Baby Chicks?" "Fireless Brooders," "We Ship Chicks in Fireless Brooders," "When to Go Into the Poultry Business," "There is Money in Eggs and Poultry," "Will the High Prices Last?" "Baby Chicks Ship Safe," "A Chick in the Hand," "Who Can Enter the Poultry Business," "Poultry Business Open to All," "Poultry Raising by Disabled People," "Broilers for Market," "Your Opportunity," "How to Start," "Where to Start," "Poultry for Market or Eggs," "Little Capital Required," "Vitality in Poultry," "Poultry Successes," "Keep Chicks Warm," "Opportunities in the Chicken Business," "Get Started Right," "As a Side Line," "Order Early," "How Shall I Start?" "About Prices," "Stock and Eggs," "Egg Farming on the Colony Plan," "How to Care for Baby Chicks" (2 pages), "Good Layers," "Our Own Flock of White Orpingtons," "The Best Breed," "Combining Poultry and small Fruit," "Eggs From Pure Stock," "Poultry and Specialty Vegetable Growing," "Pure Bred Stock," "Thoroughbred Males," "Poultry Shows." These are the headings of the articles we write for you free. If the book is worth one cent just say you want it on a post card. No book of its kind has ever been printed. It's the largest of its kind ever printed anywhere by anyone. Get a copy. Visitors welcome always.

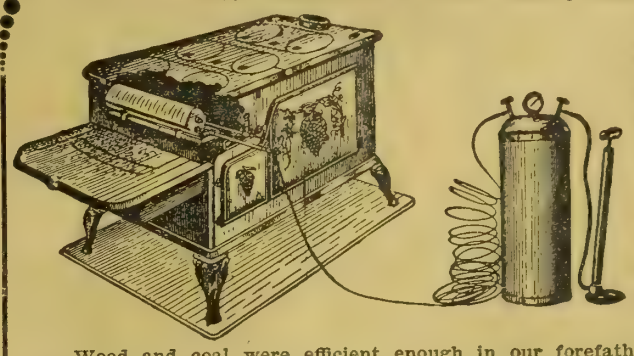
GAS!——You Can Have It In Your Country Home——GAS?



Or anywher for cooking, heating, brooders, lemon curers furnaces or anything that requirers heating.

More Efficient Than Wood or Coal

and givesi mmeasurable comfort and convenience.

How We Solve The Fuel Question

Wood and coal were efficient enough in our forefathers' days when the modern methods were unknown, but with its ashes, dirt, labor and inconvenience it is no longer giving that state of comfort and refinement so much sought after by the modern home, to say nothing of its scarcity and enormous expense. Would you be interested in a proposition whereby you are saved one-half your present fuel bill and given all the conveniences of a city home? Our home-made gas system gives you this. There is no smoke, soot, odor, noise, danger, ashes, dirt, building fires nor carrying fuel. Gives you quick and unlimited heat, pleasure, efficiency, economy, and convenience, and in short improves your home immeasurably.

Absolute Guarantee—Each and every outfit is covered by a positive guarantee.

If you are looking for these advantages, write for further particulars at once. Let us tell you what we can do for you.

Buy Killefer Farm Implements

Killefer Farm Implements are finding favor with every man who works the soil–we are shipping all over the world Killefer Orchard, Field and Road Tools which make farming easy.
Killefer Farm Implements are best known to Southern California, but their fame is spreading, as is evidenced in our shipments to the Hawaiian Islands, Mexico, South Africa, Portland, San Francisco, Ohio and even to the Atlantic Coast, Long Island Sound. "Enduring satisfaction in the tools we make tells the story of our success." If you want the very best implements take your neighbors' advice and buy those made by the Killefer Manufacturing Company, Los Angeles, California.

Because

We are thoroughly equipped to fulfill your needs, and will also make special tools for special work.

Because

You are fully protected in our guarantee of thorough workmanship and highest quality materials.

Because

All Killefer tools are made for lasting service.

Plant of the Killefer Manufacturing Co.

Because

Killefer Farm Implements have a reputation for being right up to date in every way.

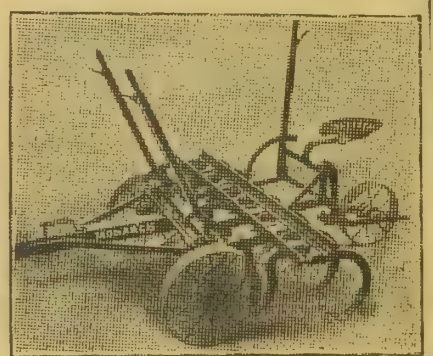
Because

New valuable and practical improvements are being constantly added to Killefer implements wherever possible.

Because

We know from actual working tests that every Killefer tool will meet all requirements.

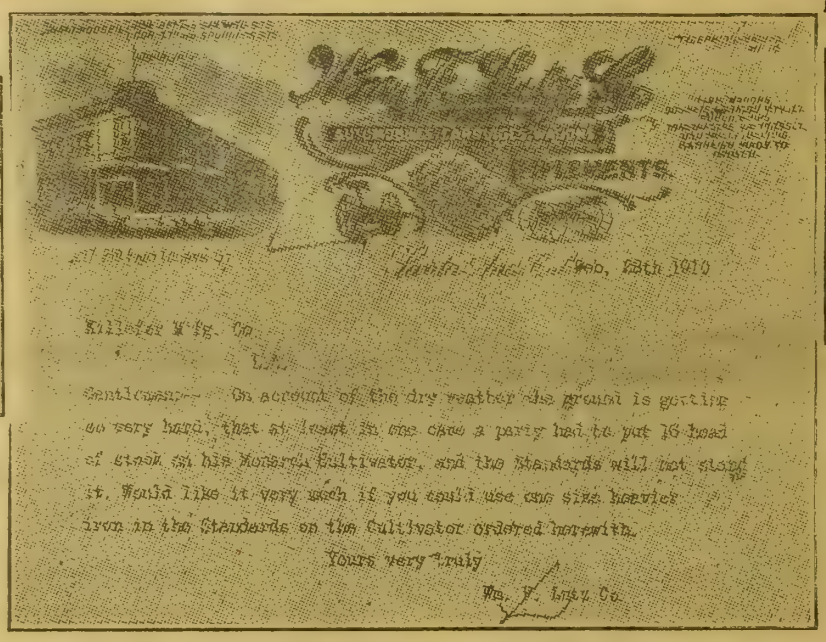
Our Monarch Cultivator



is designed for heavy work. Has great clearance (17 inches) between front and rear standards, which permits the working of trashy or lumpy ground, and lightens the draft.

Designed for field use, but has also become a favorite where deep cultivation is desired.

By the arrangement of the levers, it can be carried level, or deeper on one side, if desired, and held there.



Killefer Mfg. Co

Gentlemen:— On account of the dry weather the ground is getting so very hard, that at least in one case a party had to put 16 head of stock on his Monarch Cultivator, and the standards will not stand it. Would like it very much if you could use one size heavier iron in the standards on the Cultivator ordered herewith.

Yours very truly

Wm. F. Ley Co.

La Verne Rotary Cultivator

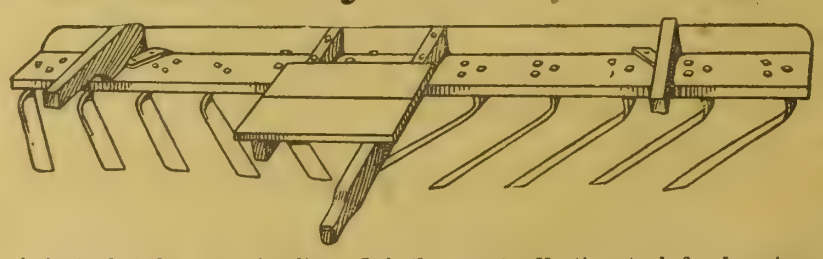
The principle of Rotary Cultivator, is an entirely new one; the action of the teeth in the soil being different from solid, cut away discs or ordinary Cultivators. It carries absolutely no soil with it and can be used at a greater depth with less draft than any other cultivator on the market today. The tool works close to the ground, with no wheels or attachments to catch limbs or tear off fruit,

The Killefer All Steel Scraper

Our steel scraper is made of the best material in the market for this purpose. The blades are hard plow steel, giving the very best of wearing quality. We particulary ask Dealers and Contractors to compare this Scraper, made in Los Angeles, with Eastern or other makes and note the strong manner in which they are put together. We carry repairs for this and all other makes.

Write for prices.

"Nothing Less Could Break a Monarch', Killefer Cyclone Weeder



is just what the name implies. It is the most effective tool for keeping down the growth of weeds after rains or irrigating an orchard, beet, bean or grain land. Does twice the work with the same team of any other tool, and as the knives overlap each other, it is impossible to miss anything in their course. Tbey are built in 6, 8, 10 and 12 foot sizes.

South African Agent

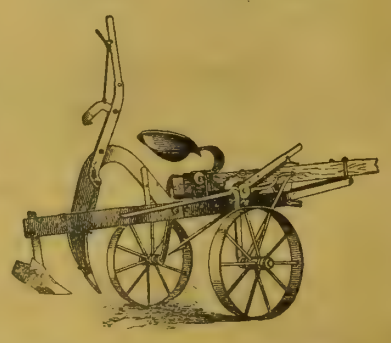
To Africa

After a thorough canvas of the orchard sections, Mr. R. A. Davis agent for South American Government selected

The Killefer Monarch Cultivator ***The Killefer Orchard Cultivator***
The La Verne Rotary Cultivator ***The Killefer Clean Cut Weeder***

to be shipped to Africa soon. Mr. Davis said that it was the strong recommendation of farmers generally that caused him to give our goods the preference.

Our Jumbo Sub Soil Plow



A very strongly built plow for deep heavy work. Shin point and Landside are made of hard steel. No better tool can be found for breaking subsoil hard pan in orchards. If used prior to winter rains will cause soil to retain the moisture. We guarantee this plow to give perfect satisfaction in this kind of work.

Vol. XXXVII. No. 14. LOS ANGELES: THURSDAY, OCTOBER 5, 1911 One Dollar the Year

Nurserymen and Horticultural Authorities

By M. McDonald, Orenco, Ore., Before Pacific Coast Nurserymen's Convention

In the early days of horticultural legislation there seems to have gone forth an erroneous idea of the true aims and purposes of such legislation. Horticultural authorities appointed to administer the laws often assumed that the only purpose for which these laws were enacted was a rigid, sometimes unreasonable inspection of nursery stock, forgetting that education should be the basic principle in the administration of all such laws, and that destruction of property should only be resorted to in extreme cases, and after all means of eradication have been tried, and then by due process of law, never upon the mere opinion of one man. Inspectors were often appointed, not because of their peculiar fitness for the work to be done, but rather to pay some old political debt. Great annoyance, inconvenience, and endless financial loss was the result of the unfair conclusions so often arrived at by inspectors, who perhaps had no previous knowledge of insect pests or fungus diseases, but who, taking their certificate of authority to inspect, as a license to enter in upon any kind of nursery property and destroy the same, without allowing the nurseryman time or opportunity to appeal to higher authority, or take his case before the courts of common law. Of course after the nursery stock had been destroyed by fire, the evidence as to whether it was affected or not, was also destroyed, and the nurseryman was left without recourse.

Unreliable Work.

Another very effective form of destroying nursery stock by unreliable inspectors and horticultural commissioners was to quarantine the shipment on the inference or presumption that the stock might be diseased or infected, and in this way creating a suspicion among the nurseryman's patrons, and cause them to refuse to receive the shipment on the pretext that they might be diseased and that the infection could not be seen at that particular date. This method was just as effective in the destruction of the nurseryman's property as if the trees had first been condemned and destroyed by fire.

Inspectors often have used their official positions to discriminate between the nurseryman with whom he was on friendly terms, and the one who did not live in his vicinity or state, sometimes condemning whole shipments on a mere technicality, while stock of the local nurseryman, who was a friend of the inspector, would be passed and a certificate issued even when found to be in a diseased condition.

This point is well illustrated in an experience the speaker had some years ago in one of the Pacific Coast states. A large shipment of trees had been condemned and destroyed by fire, without allowing the nurseryman an opportunity to prove whether the shipment was diseased or not, only a very few peach root borers having been found in the entire carload of mixed trees, at the same time a tree yard a few miles away, containing thousands of pear trees, carrying this same inspector's certificate, and being distributed with his knowledge and consent, was found to be literally covered with San Jose scale. In this case the nurseryman who had the diseased pear trees was a relative of the inspector, while the nurseryman whose carload of trees was destroyed, was from a foreign state. When the inspector's attention was called to this open violation of the law, he passed it off with the remark that they did not mind San Jose scale in their section, and yet the very law under which he was authorized to inspect, specifically mentioned San Jose scale as one of the pests that was to be especially fought.

Inspectors always should be selected because of their fitness for the work and only after some form of examination was gone through that would determine their qualifications for the work to be done.

Under Bonds.

A man to whom is entrusted work carrying such great responsibilities and power over the property of other persons should be under bonds, or in some way held responsible for the faithful performance of his duties.

Nurserymen Should Aid.

Looking at this subject from the other side, nurserymen were very slow in the earlier days of horticultural legislation to appreciate the great benefits that would come to their particular business through the enactment of legislation which had for its purpose the control and ultimate eradication of fruit tree pests and fungous diseases, and too often it was hard to get the nurseryman to fall into line and work in harmony with the horticultural authorities, for the extermination of these pests and diseases. It has probably taken as great an effort on the one hand to get the nurseryman to realize that horticultural laws, when impartially enforced, are of as great benefit to him as to the orchardist,—as it was to get fruit tree inspectors to realize that such laws were not made to worry, annoy and destroy the property of the nurseryman.

However, these conditions have, to a very great extent, passed away, and today we find the nurserymen and the horticultural authorities working in harmony for the mutual upbuilding of their common interests, except in some of the newer sections, or where the nurserymen and inspectors have not been brought together to discuss these vital subjects of mutual benefit to both; and here let me say that in my opinion the Pacific Coast Association of Nurserymen has done more than any other one medium to bring about that feeling of harmony and good will that today exists between the nurserymen and inspectors. This condition has been brought about by this association inviting the commissioners and inspectors to meet with the nurserymen at these annual gatherings, at which time papers have been read and discussed, bearing upon every phase of the question until today, in this, the great state of California, where possibly there has been more discord and bitterness between the nurserymen and the authorities than in any other state, and where it was supposed the hatchet would never be buried, and the pipe of peace never smoked.—we have with us as our honored guests some of the most learned and noted horticultural authorities of the day ,who, I am told, are also preaching this same gospel of peace, harmony and good will to all.

Cured a Grouch.

As an example of what this association has done in bringing together the different interests to discuss these questions of mutual interest, allow me to tell you a little story regarding a fruit grower, resident of one of our Pacific Coast states, who had a supposed grievance against all nurserymen. This man was usually found at all gatherings of a horticultural or semi-horticultural nature, and was in the habit of addressing such gatherings, and he never missed an opportunity to tell the people what a terrible lot of fellows the nurserymen were. In his estimation, every man who engaged in the nursery business was a criminal, and upon every occasion he roasted the nurseryman to a finish.

Well, the members of the Pacific Coast Association of Nurserymen conceived the idea of inviting him to address them at one of their annual meetings, and there let him air his grievance before us in a body. The association even went so far as to hold its annual meeting in his town. He came to the meeting, told his story, which was the same old story of misplaced confidence. He had bought some trees from one of his neighbors who was really not a nurseryman, but rather an orchardist, growing nursery stock on the side.

Some of the trees proved to be untrue to name, and forever after, until he attended this meeting and was converted, he supposed that all nurserymen were fit subjects for the penitentiary. The association took pains to show him the difference between the real nurseryman and the orchardist who is just growing a few trees as a side issue, and also explained to him the great responsibilities that nurserymen carried; that they were really a part of the great horticultural interests of the country, as well as the orchardist, and as a consequence he was converted, and is today one of the best friends the nurseryman has. He goes to the horticultural meetings now and instead of knocking, he explains to the orchardist the importance of buying his trees from reliable nursery sources, also advising the mutual co-operation of nurseryman and orchardist.

Interests Are One.

Our experience with this man simply illustrates the great necessity and importance of association; the coming together whenever occasion permits of the fruit grower, the horticultural authority and the nurseryman, counseling with each other as to the best methods for the enforcement, along fair lines, of the horticultural laws, so that through their united efforts all insects, pests and diseases injurious to fruit trees may be kept in check and so far as possible finally exterminated, thereby reducing the injury done to the minimum point, and with the least possible expense and friction; each interest recognizing that the other has an important part to play and should be protected to the fullest extent, and that all may work together as one harmonious whole in the upbuilding of the greatest industry of the Pacific Coast.

SALAD PLANTS.

By O. M. Morris.

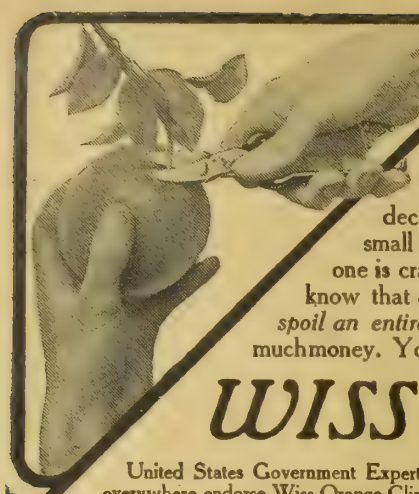
Very many cultivate nothing but lettuce as a salad plant. There are so many plants that are now available for this purpose that a list and description of them may have interest.

After lettuce, chicory and endive are probably the most commonly used by our French connoisseurs as plants to be used straight or in mixture with lettuce in salads. Endive is as easily grown as lettuce, but chicory requires more care, to have the finest flavor. Not long ago, in my travels, a Frenchman who caters to high class French family trade showed me how he grew this delicately flavored plant to perfection. He sowed his seed in a seed bed, and when plants were quite large and strong he transplanted them into beds about four feet wide, with walks raised two or three inches to allow good irrigation. Over these beds he spread coarse straw or hay about three inches deep. This mulch was laid loosely over the plants, and the plants were allowed to make their growth underneath the straw. This method causes the plants to "bleach," and when cut they look a little like blanched celery.

Another method used by some growers is: As soon as large, healthy plants are obtainable, the "parsnip-like" roots may be lifted and transplanted into deep packing boxes. The boxes are, say, two feet deep, with six or eight inches of soil filled in and well settled. These boxes are covered with cloth or burlap and kept well watered. This process blanches the leaves in fine shape. Two or three boxes of one yard square surface will supply a family through the season with the most delicately flavored salad, or to serve as part of a mixed salad.

Chives are almost indispensable for a mixed salad. These are as easily grown as onions—either from seed or division of root clumps. There are many who also think their salad lacks flavor without the dandelion, but as this is such a pest in the garden and lawn it is not very popular with the American gardener.

Suitable plants for salads are becoming more popular and important each year, and the market gardener that can produce the finest product finds ready sale. Nearly everyone has enough space in their garden to grow all the salad plants that a family can use, of good, clean and fresh quality, surpassing any grown and marketed in the usual way.



Stop *Bruising* Fruit and *Losing* Money.

Every time your clippers pierce an orange's skin you open the way to decay. Usually the cut is too small to *notice*—and the bruised one is crated with the good. *You* know that *one decaying orange may spoil an entire crate*—you lose just that much money. You *won't* bruise fruit if you use

WISS ORANGE CLIPPERS

United States Government Experts and leading citrus growers everywhere endorse Wiss Orange Clippers because they *know by experience* Wiss Clippers *last longest, do best work* and *save money* by *minimizing* the liability of bruising the fruit.

The blades are specially curved and ground—the points and outer edges are smoothened and rounded to avoid bruising. Handles are shaped to prevent tiring of the hand. Wiss Orange Clippers will give years of service—and are unrestrictedly guaranteed to give satisfaction. *For sale by all dealers.*

Wiss Solid Steel *Pruning Shears* will snip a broom handle and cut the most delicate tendrils. All parts are interchangeable and any broken parts can be readily replaced. 9-inch size, $2.25.

Citrus and Tropical Fruits

GREEN ORANGES.

By G. Harold Powell, in Circular No. 4, Citrus Protective League.

As the season for the shipment of Navel oranges from California is approaching, it is well that the attention of growers and shippers should be called to Food Inspection Decision No. 133, issued by the United States Department of Agriculture. The decision refers to "the coloring of green citrus fruits," and reads as follows:

"The attention of the Board of Food and Drug Inspection has been directed to the shipment in interstate commerce of green, immature citrus fruits, particularly oranges, which have been artificially colored by holding in a warm, moist atmosphere for a short period of time after removal from the tree. Evidence is adduced showing that such oranges do not change in sugar or acid content after removal from the tree. Evidence further shows that the same oranges remaining on the tree increase markedly in sugar content and decrease in acid content. Further, there is evidence to show that the consumption of such immature oranges, especially by children, is apt to be attended by serious disturbances of the digestive system."

"Under the Food and Drugs Act of June 30, 1906, an article of food is adulterated 'if it be mixed, colored, powdered, coated or stained in a manner whereby damage or inferiority is concealed.' It is the opinion of the Board that oranges treated as mentioned above are colored in a manner whereby inferiority is concealed, and are, therefore, adulterated."

"The Board recognizes the fact that certain varieties of oranges attain maturity as to size, sweetness and acidity before the color changes from green to yellow, and this decision is not intended to interfere with the marketing of such oranges."

It is the evident intention of the government to make it unlawful to ship into interstate commerce green oranges that are unfit to eat but which are colored by sweating to give them an appearance of ripeness.

GREEN MANURING.

By Gerald Geraldson.

I should like to make a few comments touching the matter of "green manuring," discussed in your issue of August 31.

If I am not very much mistaken, "green manuring," so called, is just a transient fad, which does not do nearly so much in the way of soil building as it is credited with doing, and which will soon be fully demonstrated to be incapable of "holding up" any soil. It will also be found, in my opinion, that whatever benefit does come to a soil from the plowing in of cover crops, in the green state, is due to the limited percentage of matured or nearly matured vegetation contained, and not due to the green, soft part of the crop to any practical extent.

I have been more or less closely attached to the same piece of California land for nearly forty years, which is much longer than the majority of California orange groves have been planted, and much longer than most of their proprietors have been in the state, and I have had as good, and perhaps better, opportunities to observe "green manuring" and its benefits (?) over a term of years longer than the experience of almost any orange grower or other "green manure" faddist, and my experience has shown quite conclusively that "green manuring" is of no permanent value.

I have started time after time with a newly cleared piece of land, which at first would produce a strong, vigorous crop of green vegetation every spring, which would easily average eighteen or twenty inches high, and have plowed it under year after year, and have worked the ground well otherwise, and have manured it quite liberally into the bargain, and still, invariably, within twenty years the soil would be so depleted of humus that at the end of that time it would not produce a crop of vegetation averaging two inches high. When it had reached this state, as it invariably did within twenty years, fruit trees would cease to make a satisfactory growth, the fruit on them would not "size up," the soil would bake like cement, and water applied to it would run off much as from a cement walk, the soil having but the merest fraction of the water storing capacity that it had had at the start.

Now, these are facts that can be easily substantiated, and they show beyond any doubt that the humus content of the soil observed had fallen off enormously, which would not have been the case had green vegetation been capable of being transmuted into humus anywhere except in the human mind. As I said before, this was not one isolated experiment, but was tried time after time as piece after piece of new land was cleared, and the result was invariably the same. On some thin spots of hillside soil the crisis—that is, the point where the crops fell below the paying point—was reached within ten or twelve years.

Invariably there was plenty of humus and a liberal supply of green vegetation at the start. Had the green stuff plowed into the soil had any soil building qualities of consequence the succeeding crops of vegetation and the vigor of the trees growing on the land would have remained the same or would have increased, but, on the contrary, they both, after the first few years, declined rapidly, just about in proportion as the original supply of humus was worked out of the soil, showing that little if any new humus had been added since we first commenced cultivating, although we had plowed hundreds of tons of green vegetation into the soil.

I am quite confident that by the time they have followed it up for twenty years the present enthusiasts will be content to abandon "green manuring," or to let the crops they plant, or the crops of native vegetation growing on the land, mature before plowing them into the soil.

It all simmers down to this: Soil consists of pulverized rock and humus in varying proportions. Humus comes from cellulose. Cellulose is the solid part of matured vegetation. Nature always uses this formula. Nature knows. Green vegetation is largely water. Water does not make humus, hence "green manuring" does not make humus, but slop.

Agriculture is not possible without a reasonable definite percentage of humus. Civilization is not possible without a system of agriculture which is more than self sustaining. Any system of agriculture which leads to worn out farms is not self sustaining, but, on the contrary, wanton exploitation and waste, which must lead to the bankruptcy both of the individual and the community.

Clean annual cultivation of any soil rapidly wears out, burns out and otherwise dissipates the humus which it contained in its virgin state. Only that system of agriculture which replaces the humus used on a practical basis as it goes along can be permanent. Hauling manure, which is a common way of replacing humus, is not practical in any large way, because there is not enough of it, and because as machinery increases it will decrease.

To be practical a humus supply must, in the first place, really provide humus. Then it must be applicable to all soil, not merely to a small percentage of it; it must be along natural lines; must tend to conserve the soil already formed, not to dissipate it; must not involve overmuch labor, and must increase rather than decrease as time goes on, for as we become civilized our population will increase very rapidly, and our food supply must increase with it.

Only one plan has appeared so far that does conform to this standard, and that is simply to obey a well established natural law which reads about as follows:

"To secure a permanently increasing output from any soil, one-half of the annual crop of natural vegetation must be returned to it, fully matured,

Every Orange Grower in California

and every other user of

FUMIGATION CYANIDE

Best Fumigation Cyanide is Cheapest

The best fumigation cyanides do not contain over one per cent Sodium Chloride.

Cyanides sold for less than the market price generally contain from 7% to 15% sodium chloride, which is a dangerous element and robs your cyanide of its true efficiency. Furthermore, an extreme sodium chloride content causes twice the percentage of its own inaction.

should be well advised before purchasing his supply.

The best authorities unanimously agree that for the effectual generation of Hydrocyanic acid gas, a Cyanide should not contain in excess of 1 per cent of Chloride of Sodium (common salt). A higher percentage of the ingredient materially reduces the available amount of gas by the process of decomposition.

BEWARE OF ADULTERATED CYANIDES!

Inferior and so-called Cyanide of Potassium is sometimes offered the uninformed at a price below the market.

In nearly every instance it proves to be nothing more than a low-grade sodium cyanide carrying from 7% to 15% Sodium Chloride—such cyanide bears no manufacturer's brand or label.

Facts Orange Growers Should Know

That the only eradicator of San Jose Scale and other insect pests is in the use of a fumigation from Hydrocyanic Acid gas, generated from cyanide of Potassium 98-99% or Cyanide of Sodium 128-130%.

That it is endorsed by Agricultural Experiment Stations.

That it is worth your while to know the sodium chloride content of the cyanide you purchase and if in doubt have a reputable chemist furnish an analysis.

Only One Eradicator of San Jose Scale

Fumigation from Hydrocyanic Acid Gas generated from

Cyanide of Potassium 98% 99%

or Cyanide of Sodium 128% 130%

the only positive eradicator of San Jose Scale and other insect pests affecting citrus and deciduous trees.

ENDORSED BY AGRICULTURAL EXPERIMENT STATIONS

—AND IS THE—

Growers Should Co-operate

Through recent investigation it has been proven that a considerable amount of low grade sodium cyanide is on the market. It is probable that some concerted action may be taken by the growers to protect themselves in the purchase of this inferior quality. Analysis by local chemists shows some of the cyanide to contain as high as 15% Sodium Chloride.

Prof. R. S. Woglum contends that a fumigation cyanide containing in excess of one per cent of sodium chloride is unfit for use.

Kind of Cyanide to Use

The Roessler & Hasslacher Chemical Company's Guaranteed Cyanide of Potassium (98-99 per cent) and High Test (128-130 per cent) Cyanide of Sodium are manufactured expressly for fumigating and contain no reactionary chemicals. The manufacturers of this material have studied the requirements necessary to produce definite and dependable results.

IT GENERATES QUICKLY, affording the required degree of density of gas under the tent.

CONTAINS NO CHLORIDE OF SODIUM, insuring the highest efficiency and maximum evolution of Hydrocyanic acid gas.

F. W. BRAUN

363-371 New High Street, Los Angeles, Cal.

DISTRIBUTING AGENT FOR

What Salt does to Cyanide

Sodium Chloride, or common salt in Cyanide causes twice the percentage of its own inaction, thereby greatly reducing the efficiency of your fumigating Cyanide.

That an unusual amount of "salted" or diluted cyanide is now on the market has been proven.

If you have reason to doubt the quality of the next cyanide you purchase, you should insist upon an analysis. Its true chemical content is vitally important and should not show over one per cent of sodium chloride.

by means of biennial cultivation or moderate pasturing."

I have followed this plan now for ten years, and have found that it, and it alone, "does the trick." I took the land described above when it had reached its worst—a two inch crop of grass, etc.—and in the ten years I have brought it back to almost virgin conditions of humus content, water storing capacity, vigor of trees growing thereon, and volume of crop produced thereon.

Applying this plan to general farming requires the working of alternate tracts on alternate years; applying it to orchard or vineyard culture requires the working of alternate "middles" on alternate years, which is the plan we have followed from the start of the new regime ten years ago. On the "middles" not plowed we have allowed all of the natural vegetation to mature, not pasturing off any of consequence, and have plowed it into the soil the following spring.

When a soil is never plowed, nature produces at her primitive level of efficiency. When a soil is clean cultivated annually, it is robbed by what is really excessive use or exploitation, as well as by the wearing out and dissipation of invaluable humus accumulated through a long period of time, and it is prevented from replacing any of the humus, a double loss. When a soil is cultivated biennially, nature is really assisted; first, by the conservation of the humus already stored up; second, by the reduction of mechanical wear and exposure to wind and sun one half; and, third, by the addition each year of an amount of matured vegetation, cellulose, more than sufficient to replace the amount used up by the crops produced on the cultivated half during the same year, or on this piece during the previous year, a double gain.

One writer in your "green manuring number" says that farmers who have plowed stubble into the soil have found it a distinct detriment to the succeeding crop, because the stubble did not rot soon enough. Most likely his neighbors laughed at him, and doubtless the professors warned him against the dangers of breaking away from the beaten path. Then, doubtless, he plowed it under the spring after he had harvested the crop, and tried to raise another crop immediately, which is like trying to make the hired man work both day and night, and which does not at all conform to the law I have outlined. But, in the face of all this, if he had persisted his soil would certainly be much more productive today than it is. True, matured straw requires some time in which to decompose, because there is some reasonable amount of substance, cellulose, to it, and cellulose makes humus, see? Biennial cultivation always leads to a crop of matured native vegetation which is finer and probably has other advantages.

This same writer glories in the quick rotting qualities of "green manure," but this is its damning indictment. It rots quickly because there is nothing of consequence to it but water, except as it is matured. He also says that "in our California soils sourness is not feared," and "so far no one has made the land sour in California with green manure." If sourness is not feared it is because of ignorance. We invariably made our soil sour as long as we had any green grass of consequence to plow into it, and so has anyone else similarly situated. The only place where this is not so is where the soil is so porous as to permit of the evaporation of the acids formed before they can accumulate.

The warning sounded against plowing a mass of dried vegetation, leaves, etc., into the ground, and against letting a cover crop get too old, lest it "act as a detriment to the soil," is about on a par with the action of that other California farmer who hauls what little stable manure he has out on to a vacant lot and burns it, lest "it poison the land." This law applies just as well to pasturage as to cultivated land. Its insane violation has led to the present low output of our stock ranges just as directly as to the present condition of our grain fields.

A good covering of grass shades the soil, prevents wash, conserves the rainfall, enabling seed to sprout much earlier than on bare ground and sheltering the young grass to such an extent that it gets a very much better start than that struggling along in the open, exposed to wash, to heat, to wind and to cold. These advantages are obvious to stock men, and they apply equally well in the orchard or on the farm.

On land cultivated biennially the crop of native vegetation will increase very rapidly. Whereas ten years ago our crop averaged about two inches, now it will average over two feet high, and thick in proportion. Through the large amount in the soil and that standing (which is generally laid out across the flow of the water) wash has been eliminated, although our land is all hilly.

Another thing: it is a fact that soil benefits from lying still every second year. This is a necessary rest, analogous to the sleep of the hired man, or any other animal. Earth worms have a chance to work through it and to multiply, and there are other factors at work about which we do not know much as yet.

Again, biennial cultivation makes conditions right for bugs, ants and other forms of animal life, and they thrive immensely, to the great advantage of both land and landlord. I think that pests can be held in check much more readily under this system than under clean cultivation, because there is home and opportunity for their natural enemies.

Rayo LANTERNS

You Can Feel Safe

when driving home at night if you use a Rayo road lantern.

Its strong, white light reveals the road ahead; the ruby disc in the reflector is a warning in the rear.

It is attached to the vehicle by a simple bracket. Lift it off, and you have a first-class hand lantern.

Rayo lanterns are made in numerous styles, sizes and finishes. They are the strongest and most reliable you can find, and **will not blow or jar out.**

All Rayo lanterns are equipped with selected Rayo globes, clear, red or green, as desired. Wicks inserted in burners, ready to light.

Deciduous Fruit Culture

APPLES FOR SHOW PURPOSES.

By R. S. Herrick, Colorado Agricultural College.

The demand for better fruit on the part of the consumer is increasing, and, on account of this, competition between the different fruit growing sections is quite keen.

This competition is not only found in the different fruit markets, but is shown at our fairs and apple shows. The people in every apple growing section like to see their fruit win the highest recommendation and approval wherever it is found on the market or on exhibition.

The lack of knowledge in selecting fruit on the part of the apple grower is often the reason why the best representative specimens are left, while some overgrown, poorly colored ones are expected to win the premiums. For this reason it would be well for every orchardist to study the different points upon which apples are scored and judged.

The following score card for plate exhibits is one that will be used at the American Apple Exposition, Denver, Colorado, November 12-18, 1911.

For perfection .....100 points
Size (normal)..... 10 points

It will be noticed that size counts for but one-tenth of the points given for all requirements. The apples should be of good size, but not overgrown for the varieties. It is much better to have five apples of medium, uniform size than it is to have them of different sizes, even though part of them are large.

Uniformity and trueness to type .....25 points

These two conditions are very important ones and should receive special attention.

The five apples should be so uniform in size that they resemble so many peas in a pod; one should compare one apple with another and see if they are exactly alike in form and size.

A pair of measuring compasses will facilitate matters in securing uniformity of size.

In selecting for trueness to type, one should know what the correct type is for variety. Look over carefully the different trees of the same variety and fix in mind the prevailing type.

Color .....25 points

The color should be the best obtainable for the variety. Do not rub or polish the apples, as this destroys the natural bloom, and many judges will disqualify apples when thus treated.

Texture and flavor.....20 points

The time of picking, care and manner of handling have much to do with texture. If the apples have to be kept for any length of time they should be picked when they reach maturity and stored where a uniform temperature of thirty-four degrees can be obtained.

With the proper management of the orchard as regards pruning, thinning, spraying, irrigation and cultivation, much good can be obtained in securing better texture and flavor of the apples.

Freedom from blemish.....20 points

This means that the apples should be free from all worm holes or bites, frost and hail marks, limb bruises, spray burns, etc. The stems and calyxes must be intact, and they should be of the correct size and length for the variety.

Be very careful in picking and packing not to bruise nor unnecessarily to rub the specimens, as this may have much to do with determining the decisions.

WHEN TO PICK APPLES.

Mr. U. T. Cox, one of the best apple growers of Ohio, said as to the best time for picking the fruit, before the Maryland Horticultural Society:

"Let apples hang on the trees just about as long as they will hang there without getting mellow. When an apple ceases to grow it takes on a better quality. It has been proved that that apple will keep longer than one which is packed before it matures. That is what we want. We have been making two pickings on the trees as a general thing and sometimes as many as three pickings. It will pay to pick over your apple trees twice, because you can go in that orchard and find some riper than others. Some varieties ripen more evenly than others. It will pay to pick only the ripe apples and leave the green ones on the trees, and let them grow ten days or two weeks. Apples ripen sooner than others on the same tree. We go over them and pick off the ripest and largest and leave all the little green ones on the tree. Then when we come to pick them we find apples there almost as good as the first picking.—Ex.

GROWING PEACH SEEDLINGS IN NEW YORK.

To grow a peach seedling requires a great amount of careful attention in getting the pits, having them germinate, and getting them to grow big enough to be budded the same year that the seed is planted. Northern nurserymen experience more difficulty than the southern growers, but this work has to be done in the North to get trees adapted to the climate. It is the common experience of nurserymen that peach pits taken from budded varieties will not do so well as the natural pits that are gathered in the mountains of Tennessee and North Carolina. If these natural pits could be had elsewhere, they would undoubtedly be just as good, but there is where they grow in quantities large enough to supply the demands of northern nurserymen. They are gathered in small lots by the country people there, and sold at the local store. From there they get into the hands of seed companies and nursery firms of the South, who sell them in large lots to northern nurserymen at prices ranging from $1 to $3 per bushel. These natural peach seeds are small in comparison with the pit of a budded peach. They send up a strong thrifty seedling, and a bud inserted from the scion of any standard variety of peach will live and do well on them, while on the other hand, if you take, for instance, a Crawford peach pit for this purpose, it will not do as well, the bud will not be so apt to live in it, and the young tree is more subject to peach diseases. For these reasons nurserymen do not find it profitable to use any other than the natural southern grown peach pits.

There are several ways employed by nurserymen in planting the seed. Some sow them in the fall in rows 3½ feet apart and about two inches apart in the row. They are covered to a depth of about three inches and

When writing to advertisers please say that you saw their advertisement in the Cultivator

some of this raked off in the spring when they are about to peep through. This method is attended with considerable risk. Often only half the pits germinate, sometimes none at all and the whole planting has to be plowed up. The Genesee Valley has a fine silt loam that remains quite wet in places during the winter, and nurserymen there sometimes have remarkable success with this method. Like fall planting of trees, the seeds germinate and start to grow very early, and make a better growth than those planted in the spring.

The custom most commonly followed is to put the pits in sand in the fall and wet them down well. A trench is made for them right out in the open. They should not be buried too deep, as they need to have the frost get at them during the winter. It is claimed that the frost cracks them open. Nurserymen buy a large number of pits and treat them in this way. They leave them in this trench for two or more years, going over them several times each spring and picking the meats out of the pits that have cracked open.

Cracking them open with a hammer or a peach cracker and then sowing the meats does not prove successful. The seedlings are weak, and anly a small percentage of the meats grow at all. Peach meats should be planted about one-half inch deep and not until the ground has warmed up. They are very delicate, and it takes them a long time to get above ground. When they do come up they should be kept free from weeds and well cultivated until they get a start. We do not as yet half appreciate the value, as a disease preventive both for then and for later on, in maintaining a steady, thrifty growth in a young plant. After they get well started the work on them up to September is comparatively easy. First of all the soil must be of the sandy loam type and extremely fertile. The young seedlings must have careful and frequent cultivation during the hot, dry summer months, so as to keep up a vigorous growth until they are ready to be budded in the early part of September.—Rural New Yorker.

PRUNING OF APPLE TREES.

Some pruning of apple trees is necessary to give them a good form, but should be avoided as much as possible. By attending to this work early in the life of the trees heavy pruning may be entirely avoided. If large branches must be cut off they should be removed in the latter part of winter or early in spring, before sap starts, and the wounds covered at once. For light pruning, early in June is an excellent time.

When wounds are made on trees by pruning or in other ways, probably the best material to cover them with is grafting wax. In the absence of this, white lead will be found a good substitute. Where there is a considerable wound, as where the bark is stripped off by mice, it is a good plan to cover with grafting wax or white lead and then wrap with burlap. Where this injury is close to the ground, in addition to putting on grafting wax, it is a good plan to cover the surface with soil.

The "See America First" slogan is being renewed, and now the automobile people are looking up a best road from the Atlantic to the Pacific, one northern and one southern road. A member of the Touring Club of America is now on his way from New York to Los Angeles and San Francisco. He will come by one road and return by another, and it is expected he will outline the best road on which to "See America First."

If the governor of California appoints a "clean-up" day it should be heartily entered into by every community. In fact, we know it will be well for every day to be a clean-up day and the entire state should put itself in shape for exhibition in 1915. It will take four years' practice to qualify for that one year.

In addition to the humus added to the soil by green manuring, the mechanical effect of the roots is most desirable because of opening up passage ways through which the air passes, also the chemical effect of root fluids upon the soil releases any of the

SPECIAL FLOWER SEED COLLECTION

WE will mail you a package of FLOWER SEEDS containing a dozen or more old-fashioned hardy Annuals, such as PHLOX, POPPIES, CANDYTUFT, MARIGOLD, COSMOS, MIGNONETTE, Etc.

You can sow this package of choice seeds in out-of-the-way corners of the garden, in odd beds around young trees or on embankments and with little cultivation you will have a mass of gorgeous and continuous blooms, sweetly fragrant, all through summer, till killed by frost.

This package will be sent to any address for 10c. in stamps or coin. Write Dept. A

The Ornamental Garden

THIS MONTH.

By O. M. Morris.

Of course the big interest now in the flower garden is planting Dutch or winter flowering bulbs. These are all mostly at hand now, and the sooner they go in the ground the better average yield of flowers one gets. Larger quantities of bulbs were received this year than ever before, and the supply is growing low already. Many varieties are clean up. Among the most popular selling bulbs this year are Spanish iris, ranunculus, anemones and daffodils—all are quite hardy and easily grown. The May flowering tulips are also becoming quite profitable and our florists are planting quantities for their cut-flower trade. Unfortunately the early tulips are almost a failure in this climate. But the late flowering are even finer, having longer stems and one is well paid to wait a little longer for the flowers. Every one should try a few of these May flowering varieties.

Too much praise cannot be given to the Spanish iris, they are of the easiest culture—hardy and fine for beds or as a cut flower. They can be had in separate colors, yellow, blue, white and bronze.

A fine bed of prize ranunculus and anemones are unsurpassed. They last in bloom a long time, are hardy and the colorings are grand.

The lovely carnation is gradually giving way on the Los Angeles market to the rose and bulbous flowers. Less quantities are being sold each year, although the quantity is far superior to those of a few years ago. The great quantities that have been put on the market we believe has been the cause of making the flower "common" and people, like fashions, change in their likes, and they are looking for the "novelty" in flowers or something a little out of the ordinary.

Some good flowers to grow for their special purposes are as follows. These lists embrace but a few of many adapted for their particular uses.

Dwarf Plants for Edging

Armeria or thrift, pyrethrum aureum, santolina, dwarf alyssum, dwarf candytuft, Chinese dwarf delphiniums, dwarf varieties of godetias, Festuca glauca, vittadinia. For shady borders a pretty edging is made of Primula veris, and cinerarias.

White Leaved Plants.

Glaucum or horned poppy, Centaurea candidisima, cineraria, maritima.

Tall Foliage Plants.

Elephants ears, cannas, castor oil beans, colocasias, aralias, eremurus, gunnera, malvas, etc. In shade hydrangeas are fine.

Annual Flowers for Brilliant Show.

Asters, Antirrhinum balsams, dianthus, petunias, phlox, portulaca, salpiglossis, stocks, zinnias, pansies, marigolds, and others in great variety.

Annual Flowers for Shady Places.

Annuals, or those treated as annuals are migonette, pansy, violas, forgetmenots, primulas, mimulus, lobelias, impatiens, daisies, begonias, Clarkia, cinerarias, etc.

Flowers for Wild Garden.

Coreopsis, delphinium (annual), calendula, annual chrysanthemums, cosmos, gypsophila, gaillardias, gilia, poppies, godetias, leptosyne, linaria, linums, lupins, nemophila, nicotina, petunias, marigolds, zinnias. The above could be selected as to height, planting tall in background and tapered down to the dwarf in front.

Small Fruits and Vegetables

THIS MONTH.

By O. M. Morris.

Much of the planting has been done for fall and winter gardens by this time, but it is not too late to plant most all of the hardy things, such as peas, carrots, turnips, cabbage, lettuce, beets, cauliflower, endive, kohlrabi, etc. Beans, hardy varieties as Canadian Wonders, are being planted yet or up to the 10th or 15th of this month. Plantings are sometimes cut down by frost, but very seldom before about Christmas time, and it well repays one to risk it, for during the holiday season they are worth from ten to fifteen cents a pound on the market.

Cabbage and cauliflower are being planted from seed bed now for spring crop. They are hardy and can be planted any time for succession. The big plantings being made now are for spring shipments East. Lettuce, carrots, turnips and beets are planted at any season for succession.

There is reported a great scarcity of all root crop seed this season. Beet seed is soaring high, as is carrot, turnip and spinach. There will be a marked increase in price of these seeds this season on account of shortage, some growers meeting almost complete failure. Cabbage is also on the same list as there is only 30 to 40 per cent of a seed crop, and we would warn all against cheap offers in these seeds.

While speaking of short crops, the potato situation in the East has not changed much in regard to prices. The market ranges from $1.05 to $1.75 per bushel for prime stock. This will make spring potatoes a good price on California market, as but few eastern stock can be brought in, and Idaho, Oregon and Utah will make prices according to eastern prices. On the other hand, the California bean crop will be a record one if weather is favorable during harvest, but prices are very firm.

The last of this month and first part of November will be the time to plant lettuce for northern shipping or holiday and early winter market. Large quantities are shipped from Los Angeles during winter. It takes 2½ to 3 months to make the crop. The varieties mostly used are New York (Special Los Angeles market strain) and Wonderful—both do well.

STRIPED CUCUMBER BEETLE AND THE TRUE SQUASH BUG.

The first of these, a biting insect, and the second, a sucking insect, attack melons, cucumbers and squashes; and they are often confounded, both being called "squash-bugs." This is unfortunate, because they call for radically different treatment. We would suggest planting an excess of seed; for the first named insect, dusting plants with one pound of Paris green mixed with fifty pounds of lime or cheap flour. The beetle can be to a certain extent driven away by air-slaked lime alone, dusting it liberally on and about the plants in each hill. For the true squash-bug we would recommend hand-picking of bugs in the early morning, also hand-picking of the large yellow eggs. Destroy all vines after harvesting crop. Plants can be kept covered with light frames of cheese-cloth while small.

Do not plant cucumbers in poorly prepared ground. Make low, flat hills from four to six feet apart, each hill two or three feet across and thoroughly pulverized sixteen to eighteen inches dep. Put a shovelful of well-rotted manure in each hill.

The wheel hoe saves backache and does the work of three hoes.

ROEDING FRESNO, CAL.

TREES

True Trees Are Our Standard

Our buds and grafts are all secured from the finest quality bearing trees, insuring all stock we sent out being "True to Name." Our trees are grown under our personal supervision, carefully dug and packed for shipment in "A-1" shape.

Every fruit grower should realize the importance of making a right start, and the only sure and safe plan to follow is to obtain your trees from a thoroughly reliable and conscientious nursery firm.

WE CALL PARTICULAR ATTENTION AGAIN THIS SEASON TO THE NECESSITY OF ORDERING EARLY TO GET YOUR NEEDS SUPPLIED

A Cheap Succulent Feed

Alfalfa hay is a wonderful feed, but like any other dry feed it is improved if used with a succulent feed. Dairymen have long realized that they needed something to go with their alfalfa, but have not been able to get it at any reasonable cost; so the majority have continued to feed just alfalfa, with perhaps a little bran or rolled barley.

Now is the Opportunity

You can balance your ration with appetizing, succulent Steam-Dried Beet Pulp—cheaper and better than any mill feed or grain, it makes an ideal combination with alfalfa hay—cows relish it keenly, and thrive on it splendidly. It can be used in the ration to replace an equal amount of mill feed or grain, or to replace *one and a half* times the amount of alfalfa hay.

It is the milk-producing qualities of Steam-Dried Beet Pulp which have made it famous. 8 lbs. daily, fed with 15 to 20 lbs. of alfalfa hay, forms a properly balanced ration for a thousand-pound-cow, giving about 30 lbs. of milk daily. You can safely figure on this ration to give you one to two quarts more milk every day from each cow—that means 3 to 6 cents every day from each cow. It's easy money, that you can get without the least trouble or risk.

It is also a splendid green feed for poultry. They are extremely fond of it.

Be Sure It's Steam-Dried

Steam-Dried Beet Pulp is the beets of the sugar factory with only the sugar extracted—and then *dried by steam.* The wet beet pulp has long been favorably known for its feeding qualities, but it is inconvenient, costly and objectionable to handle. When the beet pulp is *steam dried* it is packed in 100-lb sacks, and will keep for an indefinite time without spoiling. Steam-Dried Beet Pulp is always uniform in color and quality, never burnt or blackened by smoke, always clean and pure. Ask your dealer about it—or write us.

Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.

DRAFT HORSES.

By Mrs. M. E. Sherman.

The average farmer is more interested in the draft horse, especially as that gives him a good heavy draft colt that will sell on its merits as a puller, without expensive training required by the trotting or running horse. The English and German people have good draft animals, but have sent very few to us compared to the number sent from France. The English have the Clydes, the Shires and the Suffolks. All are good, the Clydes and Shires are frequently seen but the Suffolks are very rare even at the larger fairs. All three of these breeds nick kindly on the native mares. The grades of Clydes are frequently seen on the streets of Chicago and New York, but rarely in San Francisco.

The Belgian and German drafters are handsome bay or brown animals of good bone and substance, but are unfortunately rarely found in California. The French have been successful horse breeders and have pushed their horses all over the known world. In this country we are apt to think of all these horses as Percherons, while in truth there are other strains that should not be called Percherons. It is doubtful if the earlier importations can ever be separated in individual stud books. The probable course that will be pursued is to form new books taking the different animals as they arrive in this country and having them registered in the proper way. The present Percheron Society has made enemies by refusing animals that were not properly recorded or properly bred. Many have failed to understand that a stallion may be a good one and may have a proper record and yet not belong on the books of a given Society.

Different Strains.

The most powerful of all the French drafters are the Mulassieres raised in the central provinces of Duex-Sevres. These are ponderous animals with heavy bones in rather coarse legs having heavy feathering. They come from the same country, but in no way suggest the dainty china of Sevres. The Mulassiere are not in use to any extent as work animals, the mares are used as breeders for large mules. Some of the largest of these hybrids come from this cross.

The Nivernais are becoming common in California, selling as Percherons. They are handsome, upstanding blacks a little smaller and shorter in the back than the regular Percheron. The knights of old covered with armor rode the ancestors of these horses in their joustings. The Nivernais produce good colts and have the black coloring well carried to their offspring.

The Ardenais is another French breed that runs to bays and browns. These may be called big little horses as they have a heavy short body swung low to the ground. The Boulonnais is another strain that is sold as a Percheron. These have coarser bone, heavier, larger heads, are more chunky and have shorter necks. In character and disposition are like the Percheron coming in color both gray and black.

Percherons.

These are the best known and the most desired of the various French horses. They are the kindest creatures possible and the aged stallions are safe as work animals on the farm. The geldings are liked in the city, as they are rapid, smooth walkers, swinging along at five miles an hour all day long, drawing easily a load with spirit. In California we have probably three Percheron sires to one of every other breed of draft stock.

A Typical Sire.

In buying a sire of any draft breed the size of the bone and frame as well as its soundness must be considered. The animals seen at shows and offered for sale are often loaded down with fat until there is three or four hundred pounds too much weight. This weight is often paid for at a high price, for a ton stallion, selling for two thousand dollars, makes horse flesh worth a dollar a pound. In a horse, bone and muscle may be worth a dollar or two dollars a pound, but extra soap grease is dear at that price. As five pounds of barley and bran make one pound of flesh it is selling the barley at even a wilder price than the feed men are asking us today.

Grade Stallions.

At last the state has awakened to the fact that many people were being imposed of by unprincipled men, and we have a good law that now makes it necessary to record the horse and have his state license that properly calls him a grade if he is a grade or a full blood if he is a full blood. The Percheron Society of America has gathered the horse statistics of Illinois, Wisconsin, Kansas, North Dakota, Minnesota, Montana, Iowa and Utah that are interesting. In these states the grade stallions in use run from 26.4 per cent in Utah to 66.6 per cent in Pennsylvania. In Iowa no grades are licensed and therefore no list could be secured. In the other eight states mentioned 48 per cent of the stallions were grades. This represents a heavy loss to the farmers, for rarely will a grade stallion produce animals as good as himself. The reason is this, the man who raised him found as a colt he was an individual of outstanding merit and therefore kept him. Now he has no backing behind that to secure his passing merit on. As a rule even the pure bred sire will not produce more than seventy-five per cent of colts as good as himself. In purebred stock the breeder has one every now and then that he does not keep for breeding purposes, so the stallion represents not only pedigree but constant selection of the best of his strains.

The average of the states mentioned above was one pure bred sire to every five hundred horses. While one pure bred sire to every two hundred would be nearer a right proportion in a horse breeding district. The same statistics may be accused of being favorable when they say that 68 per cent of the registered drafts are Percheons, I give that for what it is worth.

Care of the Horse.

The way in which horses are often gorged during the breeding season and

(Continued on Page 333.)

Geo. A. Smith's Jersey Heifers

With First Calf Make High Yearly Records

Lady Letty Lambert, 124201

Sold for **$3600,** and produced **56 lbs. of milk** in one day, **1521 lbs.** in one month, **14263 lbs. in one year, 38269 lbs.** in 3 years; **24 lbs. 12 oz.** of butter in 7 days, **1081 lbs.** in 357 days, **2913 lbs.** in three years, and **three living calves.** 32 of her granddaughters and grandsons will be sold in the Geo. A. Smith Second Annual Sale.

In my former advertisements, I have shown what the ancestors of my Jerseys have done. Some of them have been **World's Champions and have produced over 1000 lbs. of butter in one year.** Now I am able to show what their descendants are doing **with FIRST CALF on Year's Official Authenticated Test.** The records of some of these heifers are **greater than the records of some of their ancestors with first calf,** who at maturity produced **OVER 1000 LBS. OF BUTTER IN ONE YEAR.** The following is a list of **JERSEY HEIFERS WITH FIRST CALF,** which have qualified for the **Register of Merit** under the rules of the **American Jersey Cattle Club** governing year's official authenticated tests:

Victor's Lady Queen	496	lbs. butter in one year
Marquis Pogis Violet	491	" " " "
Pedro's Marigold Queenie	488	" " " "
Cretesia Melia Gonda	478	" " " "
Victor's Francis	467	" " " "
Victor's Lady Rose	453	" " " "
Anna Burner	453	" " " "
Victor's Susie	452	" " " "
Victor's Lady Kate	437	" " " "
Cretesia Melia Flossie	436	" " " "
Loretta Smith	432	" " " "
Average for the eleven is	462	" " " "

The above tests were conducted under the supervision of the State University and the American Jersey Cattle Club. **There is no guess-work about these facts.** There is a great difference between knowing and guessing. These heifers have only received ordinary herd care and feed and have not been crowded to the limit. **What will they do when they reach maturity?** Some may make **over 1000 lbs. of butter** each in one year, as some of their ancestors have done.

In addition to the above **there are now 33 cows and heifers undergoing Year's Official Authenticated Tests** and are **making high records.** Some of these heifers and others equally as good will be sold in the

WALNUT PRICES.

At the meeting of the Southern California Walnut Growers Association in Los Angeles last Saturday, fullest discussion was had as to this year's crop and prices. It was conceded that the crop will be large, but at the same time that the European crop will be small. Many were in favor of the recommendation of a 15 cent price for No. 1 soft shells; others desired a lower price and the earlier disposal of the output. A compromise was finally effected in the recommendation of 14 cents for No. 1, 13½ cents for No. 1 hard shells, and 11 cents for No. 2's of both kinds.

SAVE THE BIRDS.

The Bureau of Biological Survey is taking a hand in the effort to save the white heron or egrets which produce the "aigrettes" so much prized by the ladies as hat ornaments. The state of New York has enacted laws making it a misdemeanor to sell these feathers, but in most other states they are still sold. The Biological Survey has established breeding centers in the southern part of the United States and it is believed that in time will preserve this peculiar and beautiful bird from extinction, but there are portions of the United States in which the bird is entirely extinct. The work of wiping out this beautiful bird has been more rapid because of the fact that the feathers are at their greatest beauty during breeding season, and to secure the feathers at this time it has meant the loss of the mother bird's life and of her young as well.

IGNORANCE.

An inquirer requesting information through the query department of the Cultivator did not wish to make known the name, "because human nature just cannot endure to expose its ignorance to a stranger." "I never yet saw or knew of a man who wanted anyone to know he was not posted. It is a very good sort of pride we are endowed with, although it often stands in the way of advancement." The last phrase is especially true, and until we are willing to confess our ignorance on thousands of topics we will never advance. The person who secures so much information in the vast range of this world's knowledge that they have no occasion to ask for further would be an anomaly indeed. The best way to increase our knowledge is to get the best information possible and then confess up to our lack and seek for further light.

DOLLAR DOWN, $1 A WEEK.

Central California exchanges note the formation of a new farming organization which looks a trifle as if it might be floating around on hot air. According to the exchanges, the idea is for wage earners, or anyone else who happens to have a stray dollar, to pay one or more dollars per week into the till of the company, for which an interest will be acquired in the organization, which is to take up the breeding of hogs. "For the first dollar it is represented that the investor will acquire title to a hog, the succeeding dollars for the next ninety-nine weeks going to support her and her offspring." The company then reserves the right to purchase the hog family at the end of the hundred weeks for the sum of "$150.00." The prospectus says, "Hogs are a necessity," and of course claims great profits from the method which is to be pursued. The hogs may be profitable to the investor. It is of course possible that "lambs" will be profitable to the organization.

BETTER FARMS

Many of our readers may recall that nearly a year ago the Cultivator published a story of a pure-bred Holstein cow which was given as a prize for the best kept farm on the lands under the ditches of the Sacramento Valley Irrigation Co. in Glenn and Colusa Counties. The story of the winning of the prize was very interesting, and so beneficial to the farmers and to the company that a marked extension of the prize offers is made this year. In fact instead of one prize being offered, eleven are now offered.

This company has holdings in these two counties covering about 125,000 acres of land. Water has been piped and the lands are being sold off, and as an aid to those purchasing these lands an agricultural department has been organized and its director is Mr. W. S. Guilford. His advice is freely given to all who ask it and under his recommendation these prizes are offered as additional inducement to better kept farms. The eleven prizes are divided up, three going to the best general farm. These are first, second and third, respectively,—registered Holstein-Friesian cow, 3 registered hogs and 25 pure-bred chickens. The next two prizes are for the best farm first year development. A Jersey heifer and pair of registered pigs are to be the winnings. The next two to the best first year orchard. $25.00 and $15.00 worth of nursery stock go in this class. The best first year stand of alfalfa calls for a mower and a rake for first and second prizes. The best preparatory work for alfalfa five acres or more, calls for 100 pounds of alfalfa seed and a Fresno scraper.

Two judges have been selected,—Prof. E. J. Wickson, Dean of the College of Agriculture, and C. B. Messenger of the Cultivator.

GREEN ORANGES.

What is a green orange? This question is being asked in all seriousness by many Californians raising oranges in the early orange districts, as well as by orange growers in Florida. Dr. Wiley has made a ruling that "immature oranges artificially colored by sweating will be considered adulterated." Now, what Dr. Wiley considers an immature orange no one seems to know. When does it pass the stage of greenness to one of ripeness? Is there any percentage of sugar required in a ripe orange? If so, Dr. Wiley has never informed us, and therein lies the injustice of his decision. It should be very easy for him to give orange growers some information which would enable them to know when they may ship their fruit to market without danger of confiscation. Dr. Wiley's dried fruit decision was sprung at a time when it did almost incalculable injury to the dried fruit industry. In fact there were thousands of dollars taken from the pockets of the dried fruit producers. Only recently we noticed another decision affecting green teas and other colored teas. Millions of pounds were in port and on the sea coming to America, the shippers of which knew nothing of any such ruling until it was announced. While we may have no particular love for the Chinaman who is producing chemically colored teas for our consumption, it was manifestly unjust, after the many years of acceptance of the same colored teas in our markets, to shut them off without warning. During the recent attack by the food and drugs trust on Dr. Wiley and the effort to oust him from office the sympathies of almost the entire country were with him, but it is greatly to be regretted that he has no sense of justice in his manner of dealing with these questions. He certainly can give to orange growers something more definite than he has yet given as to what constitutes green and ripe oranges.

LEAKAGE METER.

One of the factors which have entered into fumigation and made most effective work uncertain has been the matter of tents, or rather the material from which they are made. It has been found by actual tests that the effectiveness has been greatly reduced by the porousness or looseness of the cloth. The percentage of this loss has been merest guesswork, and in fact often has not reached the stage of guesswork, for it has been ignored entirely. Because of this, some trees have been fumigated at considerable expense with but little or no reduction of the scale. The same tents used on a foggy night, however, have proven more effective. For a time it was considered to be due to the moisture in the atmosphere giving more power to the gas than on a dryer night. It is now proven, however, that this was simply the matter of the moisture closing the pores of the cloth and giving almost a gas-tight tent. This matter of leakage finally caused more of less investigation, and it has been partially overcome in smaller trees, which show a far greater proportionate leakage by being given a stronger proportionate dose than the larger ones. But, in the matter of material, the only safe way is some method of testing. Professor C. W. Woodworth, of the State University, has been studying this problem for several years, and he has finally perfected a tent tester, or, as he prefers to call it, a "leakage meter." Regarding this the State Experiment Station will soon issue a bulletin in which will be given tables giving exact dosage of cyanide, acid and water for a tree of particular size and with the particular tent in hand. The tester or meter is very simple, so small as to be slipped in the pocket, and the testing of a tent with it can be done in less time than this short description can be read. It appears that it will be invaluable for field work, and we imagine would be especially valuable in testing material which has been supplied by the dealer, to show whether it comes up to samples submitted or not. With the processes involving so much uncertainty, such an implement will be appreciated as one step towards more exact results.

VETCH

(Vicia Sativa)

The most valuable plant for cover crops now being used in California. For best results should be sown in September or October, if possible, and plowed under early in the Spring. Also very valuable as hay, and when so used should be sown with oats or barley to hold up the Vetch.

Northern California

Anderson, Shasta County, hopes to have a new creamery.

Twenty-four varieties of rice are being grown in Colusa County.

An artesian well was recently bored at Germantown, Glenn County.

The 16th annual fair of the Ferndale Fair Association was held last week.

A San Francisco Livestock Corporation has leased 590 acres near Healdsburg.

Chinese are building a large fruit drying plant at Dutch Flat Placer County.

Eighty acres of rice have been harvested by the Moulton Irrigated Land Company at Colusa.

Healdsburg wine grape growers are hoping prices for this season will range from $16 to $20.

Water rights have been located and reservoirs will be built on Little Stony Creek in Glenn County.

It is stated that nearly one-half of the entries at the short courses at Davis are from the cities.

Oroville, Butte County, is opening its gates to a large number of colonists on the way from the East.

The State Fish and Game Commission is endeavoring to establish Golden trout on the streams of Mt. Whitney.

An Angora goat raiser at Ft. Bidwell, Modoc County. has found the producing of mohair very profitable.

The Sacramento Valley Irrigation Company will offer more liberal prizes this year than last in its unique better farms contest.

A permanent water supply for certain Yuba County lands is to be secured through a tunnel if permission can be secured from the Government.

The campaign against the saloons which has existed in Davis which has been waged by the University Farm and the better element of Yolo County, has finally won and at midnight Sept. 1st the saloons closed.

Central California

Wine grapes are being shipped from Hughson, Stanislaus County, to Oakland.

A thousand acres of Merced County land is to be cleared and planted entirely to peaches.

The Weather Bureau at Fresno is to give special service to the farmers over the telephone.

The alfalfa acreage of Stanislaus County has been greatly increased during the last year.

The heavy rain of last week did some damage to raisins on trays, and table grapes yet on the vine.

Watsonville Apple Show boosters are securing encouragement from almost every county in the state.

The Stanislaus County Poultry Association is getting down to work and hopes to hold a show this season.

Much damage was done to potatoes and beans by frost in San Joaquin County about the middle of September.

It is claimed that Shima, the Jap potato grower, will clean up half a million dollars on this year's output.

Some new crop raisins have been delivered but it is expected heavy movement will not begin for another week.

Kerman is planning for a big exhibit at the Fresno County Fair and proposes to make the Kerman day, Oct. 5th, the biggest day of the week.

San Joaquin County table grape growers are holding back table grape shipments in the fear of glutting the market and being compelled to pay freight.

The largest shipment of green peppers ever made from the state was that made from Lodi last week when 625 lug boxes, each weighing 60 lbs. was forwarded to Tacoma. Wash.

An eastern horticulturist visiting in Stanislaus County thinks that the San Joaquin Valley will become the nursery of the world in that it will produce vast quantities of seed and nursery stock.

Southern California

The Imperial County Fair will be held at El Centro, Nov. 20-25.

The Imperial County Fair will be held at El Centro, Nov. 20-25.

Potato growers are greatly elated over the high prices of their product.

Buena Park, Los Angeles County, held a harvest home festival last week.

Corona orange packing houses are being overhauled in anticipation of a big output next year.

Imperial County Supervisors declare that excessive irrigation which floods the roadways must be stopped.

Yucaipa Valley is sending out large quantities of fine red apples. The quality of Yucaipa apples is exceptional.

Mendelson, the honey man of Ventura County, reports his output of two cars of honey about 30 per cent of a full crop.

Apricot growers of Ventura County will realize over $600,000 from their crops this year. The output will be about 22,000 tons.

The Los Angeles County Forestry Commission has been granted by the board of supervisors $25,000 for beautifying and planting roadsides.

Bean fields of Los Angeles County near Santa Monica are being reduced in extent every year by the inroads of subdivisions for home building.

A large traction engine was damaged to the extent of a thousand dollars by plunging through a bridge over the Santa Ynez River near Lompoc.

Friends of the Chuckawalla Valley are pleased over the announcement that a bedrock base has been found for the immense concrete dam in Bullhead Canyon.

European foul brood which has existed in some of the apiaries of Central California for some time, has now crossed the Tehachapi and has been found in a few of the apiaries of Los Angeles County.

The Coast

Oregon has 175,000 dairy cows valued at $7,000,000.

Hop pickers at Salem, Ore., have complained because of excessive rains.

A berry grower at Spokane, Wash., is filling an order for plants at Barcelona, Spain.

A wheat grower at Redland, Ore., is jubilant over an average yield of 50 bushels per acre.

North Yakima, Wash., has a cold storage plant which will hold a half mile long trainload of fruit.

The hay harvest at Sumpter, Ore., the biggest ever, in proving remarkably profitable this season.

An Idaho grain grower has a plant from one kernel of wheat carrying 64 straws each with a head of wheat.

Lands near Goldendale, Ore., have been greatly increased in value because of irrigation system just completed.,

The Chamber of Commerce of Pullman, Washington, is endeavoring to secure a more just freight rate to eastern points.

The annual meeting of the Inland Empire Anti-smut Association will discuss eradication of grain smuts at Pullman, Wash., this week.

One of the biggest September rains on record has caused Oregonians to smile. Some hay has been damaged, but great good was secured.

Apple growers of Wenatchee. Wash., are making greater efforts than ever for an attractive pack. Carefulness and taste has proven wonderfully profitable.

Ranchers on the highlands on the east side of the Columbia River below White Bluffs are contemplating an irrigation scheme which will cover 60,000 acres.

The new process of charpitting of stumps on the logged-off lands of Oregon has increased the value of those lands and many of them are being brought under cultivation.

Dutch Bulbs

Our first car of the season has arrived from Holland, and the Hyacinths, Tulips, etc., are of superlative size and quality.
Ask us to mail you our Free Bulb Catalog containing full Cultural Directions for California. Our Free Seed and Plant Catalog also mailed on request.

ALFALFA New crop seed, recleaned and free from Dodder. No Alfalfa Weevil where our stock was grown.

Egg-More

The biggest egg producing food made. Not merely a strong tonic, which is not advisable to be fed regularly, but a FOOD, highly concentrated and very rich in protein. EGG-MORE mixed in proportion of one pound to 6 lbs. of good ground grain feed will keep the fowls in good health, maintain a strong and vigorous system, make the hen molt early, feather out quickly and convert the protein into eggs. It has been doing just that for six years, and each year the sales have greatly increased. It is the biggest selling poultry food on the market today. 4 lb. package, 35c; 12½ lb. sack, 90c; 25 lbs., $1.65; 50 lbs., $3.00; 100 lbs., $5.50. We pay freight within 200 miles on sack of 25 lbs. or over. Send for EGG-MORE BOOKLET.

Profit in the Poultry Yard

Practical poultry people who may have ideas from their experience as to methods of feeding and housing and general care of poultry will confer a favor upon the Cultivator and its circle of readers by sending in concise accounts. Mrs. Basley is always willing to answer queries, which with the experience of others should make this a most valuable feature in poultry life on the Coast. Opinions or matters of a personal nature should be omitted, but a concise statement of facts is always valuable.

TIMELY TOPICS.

By Mrs. A. Basley.

At this season of the year the diseases that trouble fowls are usually brought on by heat, lack of shade, dirty water and spoiled food or insufficient green food. The neglect in other words of our "Rule of Three,"—"Comfort-Exercise-Proper Food."

Prevention and Cure.

Nearly every case could have been prevented by a little forethought on the part of the owner backed by common sense. Common sense should teach any one that heating and fattening foods such as Kaffir corn, Egyptian corn and the common field corn, are not adapted to the heated term and should be fed very sparingly or not all. Feed the cooling vegetables and greens, fruits and grasses in the warm weather and wait till the cooler weather of the fall for richer food, spices and condiments, if you want to feed them at all.

Vertigo or dizziness, which causes a bird to throw its head upward or backward or to bend the neck to one side, is often caused by exposure to the hot sun, lack of fresh water and sometimes from irritation of the intestines by worms, or by indigestion. The gait is staggering or uncertain, a sort of blind staggers, the bird walking backwards, sideways or in a circle. Sometimes the bird falls to the ground fluttering and making convulsive movements with the legs, and maybe unable to move for some minutes.

As treatment, apply cold water to the head and give internally 20 grains of Epsom salts. Keep the bird in a quiet, cool, shady place and remedy the defects in feeding; that is, feed green food instead of the more heating grains.

There is also a complaint somewhat similar in symptoms to vertigo which is called "limber neck." A bird so affected is unable to raise its head, which drops either on the breast or falls to one side; sometimes the head turns almost around as if the fowl were looking backwards. This disease is caused by ptomaine poisoning, which ultimately paralyzes and kills the bird. Ptomaine poison is a poison developing in animal food of all kinds. I accidentally poisoned a dozen chickens and ducks by mixing in their food some spoiled condensed milk. Some of them died very quickly, others were ill for as much as two days and I tried everything that I knew of at that time to help them. Poisons work rapidly and I then had not much experience with that poison. I have since poisoned myself and have made a painful study of the subject, and now I would give a dose of castor oil with ten drops of turpentine in it, following it with a mixture of well-beaten egg and olive oil; putting these in equal parts in a bottle and shaking well, giving a teaspoonful every two hours, after the castor oil had taken effect.

I opened the fowls to note the effect of the poison and found the intestines very much contracted, apparently shriveled or dried from the fever and spasms; some of them had streaks of blood and the liver was dark, but otherwise all other organs appeared healthy.

Limber neck is almost always caused by ptomaine poison, but possibly may also come from a disorder of the nervous system, the result of indigestion, sunstroke, or from infestation of worms. The treatment advised is: Dissolve one teaspoonful of hyposulphite of soda in half a cup of water. Give one teaspoonful of the mixture every two or three hours. Give the bird a small piece of gum asafoetida about the size of a split pea. Repeat the dose the next day.

The cases of ptomaine poisoning that have been brought to my attention have been usually traced to the animal food, generally to beef scraps or green ground bone. Beef scraps are usually a most excellent and safe food for the fowls, but in the summer time or in damp weather you should examine yours carefully. Only buy a small quantity at a time, as if you keep them in a damp, moist place you run a risk of the poison developing in it. Reject any that has a very offensive smell, or that has little rolls of a darker color in it, or any lumps. You will find white fine threadlike streaks in some of the lumps; this is poison. It is well to be very careful in this matter.

Spoiled Grain.

Avoid all grain that has any mould or mildew in it, also smutty grains. The mildew is a fungoid poison with almost the same fatality and the same symptoms as ptomaine. I remember at one time there was a fire at some miles in Los Angeles and afterwards a very large quantity of wheat that was half burned was sold as being "plenty good enough for chicken food." Letters began to come to me: "My chickens are dying, can it be from the chemicals used in putting out the fire?" I asked one of the firemen who told me that nothing but water had been used, but the dampened grain had moulded and developed the poison that killed the chickens. The best of grain is none too good for our chickens.

"Prevention is better than cure." In the autumn and when the nights begin to get cool there are two other complaints that we must be on the alert to prevent. The first is roup, and the second is chicken-pox. I have recently answered two letters from our readers about the latter.

Chicken Pox.

Chicken pox is a very contagious disease. It is not usually fatal to adult fowls but is very destructive to the young and half-grown chickens. It usually appears like small warts on the comb, around the beak eyes and nostrils and sometimes under the wings of chickens. These wart-like nodules reach their full development in from five to ten days. They soon show a central depression, an opening forms or the scab is rubbed off by the bird's beak, after which there is a discharge of a watery, or later, a thick yellowish matter, which forms a crust.

Chicken pox is a germ disease. It is said to enter by a slight puncture or wound or abrasion and many think that it is caused by the bite of a mite or flea, but it may be that the germ only enters through the puncture of the bite. Undoubtedly lice or mites carry the infection, and any abrasion gives entrance to the germ.

Chicken pox when taken in time is not hard to cure. The treatment is designed to kill the germ and cure the wound. Carbolic salve, or carbolated vaseline, or carbolic acid mixed with lard is about the best cure that I know. Another treatment is to bathe the affected part with soap and water in order to soften the crusts, and afterwards apply a solution of sulphate of copper (bluestone) a dram to half pint of water. A little sulphur added to the mash is said to assist in the cure, but give only a little, as it opens the pores and the bird may take cold.

The local treatment should be accompanied by cleaning and disinfecting the houses. The troughs and drinking fountains should be daily washed with boiling water.

When the disease first appears the affected birds should be at once isolated and treated and the houses and yards disinfected.

Roup.

You will never have roup in your flock of fowls if you have followed the directions for summer work in the poultry yard and if you have also kept all roupy birds away from your healthy birds. This may seem like a strong assertion, but it is corroborated by the professors at our experiment stations. "We never had roup

Whittier is growing tomatoes weighing a pound and a half each.

at the station," said one professor last month to me, "until we got in a pen of fowls that had it slightly." "Roup is contagious and can only be given by contagion," said another celebrated professor to me. I believe that, but there appear to be occasionally sporadic cases and there are colds which seem to run into roup. Colds of all kinds are infectious even in the human family, and more so in the chicken world.

When a chicken has a cold, especially when it is of the head, and the nostrils are running, the chicken is thirsty and whenever it drinks the germs of the cold float from its nostrils on the top of the drinking water and are ready to enter the nostrils of the next chicken that drinks and so in an incredibly short time the whole flock may become infected with an influenza cold that will be hard to cure. The moment that you see a chicken or hen or any fowl with a wet bill segregate it. Put it in the hospital by itself. Then give the whole flock for several days a small bit of bluestone (sulphate of copper) in the drinking water. A piece as big as a navy bean (white bean) to each quart of water. Or give Germozone in the water, or Douglas mixture. This is to disinfect the water and kill any germs that may be there. It also dries up the cold in the head.

Disinfect.

The germs of roup are generally spread through the yard by means of the secretions and when once present in the yards the roup bacilli cannot be got rid of except by very careful disinfection and this is valueless as long as any of the fowls are diseased. The food and water is easily contaminated by the mucus from the nose and eyes and the troughs, water vessels, etc., should be thoroughly scalded and disinfected, for the germs may remain dormant for months. As the germs cannot infect healthy fowls as long as the mucous membranes are intact and healthy, the disease does not spread for a certain length of time, although the germs may be present in the yard. Then comes a change of weather, such as a sudden cold night, or the beginning of fall and winter, or the rains set in and suddenly the disease develops and roup spreads rapidly among the birds. Like colds, other circumstances that weaken the constitution of the fowls such as unsuitable feed, bad water, unsanitary yards, etc., contribute to the spread of the disease.

It can be readily seen that the most important thing is to prevent an outbreak of the disease, and if the enemy once gets in to suppress it as quickly as possible. All diseased fowls should be separated from the healthy ones. The healthy fowls should be examined daily, with the view of isolating the newly affected birds. After the segregation of the diseased birds the poultry yards should be disinfected thoroughly with a five per cent solution of carbolic acid followed with a careful whitewashing of the walls.

Some Remedies.

A few simple remedies for colds may help beginners. One thing to be remembered is that any remedy that is successful for colds in the human family will be useful with fowls.

The best thing that I know for stopping a cold is five drops of eucalyptus oil on a bit of bread or in half a teaspoonful of honey.

One grain pill of quinine and a quarter teaspoonful of cayenne pepper is another remedy always at hand.

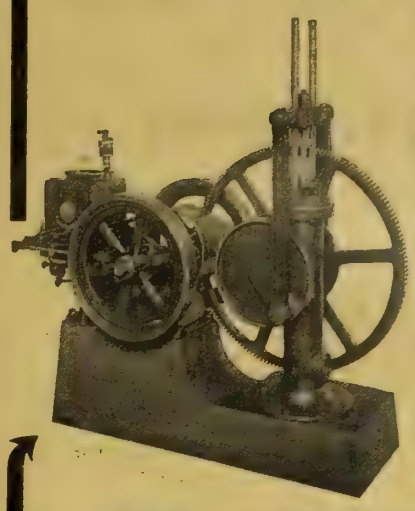
The good old formula: Mix 2 tablespoons of lard with one each of red pepper, mustard, vinegar, adding enough flour to make a stiff dough. Roll into boluses as large as the first joint of your little finger. Give one bolus every twelve hours. One dose will often effect a cure.

There need be no colds in the flock if our rule of three has been followed. If the chickens have not been crowded, have no lice and sleep in open-front houses.

A Good One.

One tablespoon of castor oil, half tablespoon each of turpentine, kerosene, camphorated oil, and 4 drops of carbolic acid. Keep this in a little machine oil can, shake before using and squirt a drop up each nostril and in the cleft of the mouth. This is an excellent cure and cheap.

Have You Seen Gregory's Triumph Engine With Direct Connected Pump Jack?



If you have not, you have not seen the latest thing in a perfect little pumping plant. Note the simplicity of this jack; direct lift each side of the piston; no wobbling or jerking, but a smooth, even stroke. Engine is fitted with pulley, so that you can run the washing machine, the churn, the cream separator, and be such a handy little helper about the place.

We have them in 1 and 2 h.p., and don't forget that we carry a very large stock of engines and pumps of all sizes. Come and see us, or send for catalogue.

Questions and Answers

THE EDITOR AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Fertilizing Chrysanthemums.

Please give best fertilizer for chrysanthemums. Is green bone meal valuable?—H. R. L., Hanford.

At this time of the year we believe we would only use nitrate of soda. The green crushed bone would be all right earlier in the season, and in fact even now might give some little advantage, but it is so near blossoming time that only the very quickest acting fertilizer should be used. If the ground is deficient in other elements, a complete fertilizer or the nitrate of soda recommended with a little sulphate of potash and super-phosphate would give quick returns.

Anonymous.

If subscriber at Exeter asking us as to separate property will write signing full name to the communication, the question will be referred to the attorney for answer in the Cultivator. Subscribers must remember that answers will not be given to unsigned questions. It is not often that we use the name of the inquirer, and never do when requested not to.

Planting Grapes.

I have a piece of adobe, has a small quantity of sand in it, not possible to irrigate, but find corn and potatoes dry out before they mature. Would grapes do well in this ground? What varieties would ripen in succession?—A. B., Santa Ana.

It would be impossible with the information given to state as to whether grapes would do well or not. What is the subsoil? Is there any hardpan or alkali? We imagine that grapes might do well, but that is poor encouragement to go to the expense of establishing a vineyard. It means too much, and one should make a thorough examination and secure the advice of an expert, unless adjoining or nearby ranches showing the same conditions offer some encouragement. The planting list will be given in a later Cultivator.

Hog Pasture.

Which is the best to plant for hog pasture, Dwarf Essex rape or peas, and at what time?—Subscriber, Porterville.

I should sow only a small piece in rape at first to see if it would make a good crop. It has been found by many farmers to be very uncertain for winter feeding in the San Joaquin Valley. Twenty years ago considerable talk about it was heard but it passed and in late years it has not been heard of as a feed. Now this may not be condemning it, but because alfalfa has been found to be the best of pig feeds and cheaper to grow. Peas may be sown now if the land is loose and can be plowed. They should be gotten in not later than December 1st if much winter growth is expected. Peas will grow only in cool weather and the more growth secured before the first of April the better will be the crop. I like to sow a mixture of twenty pounds of peas, thirty pounds of barley, thirty pounds of oats, and twenty of wheat for hog feed. This gives them considerable variety and completely covers the land. If there is any the pigs do not harvest it makes good stock hay.—M. E. S.

Timothy Hay.

Will timothy hay grow in this section on heavy adobe soil, if it can be irrigated? Could I secure more than one cutting?—A. B., Santa Ana.

We doubt not timothy would grow in this Orange County section, but we also doubt very much as to whether it would pay. Certainly if there is possibility of irrigation, alfalfa would probably produce $10 worth of hay to where the timothy would $1. You could secure but one crop. Timothy hay is not as nutritious a hay as are our common grain hays. We note, however, our subscriber says: "Alfalfa is run out by a grass known here as crab grass. It is worse than Bermuda and makes a mass of roots which check the growth of alfalfa." To overcome this we would give the ground clean culture, or, if it can be irrigated, some crop which would be profitable in that soil, corn for instance. Keep it cultivated for a year or two years, which would give opportunity to kill out the crab grass. Lands which have become foul with weed seeds are hard to handle, and clean culture is probably the only satisfactory way.

Budding Peach Trees.

Mr. P. D. Barnhart, editor of the Pacific Garden, referring to our answer as to rebudding young peach trees in orchards, says that he cannot refrain from "butting in." We suggested that two-year-old peach trees would probably give such a poor stand of buds unless the budder were an expert, that it would be as well to plant vigorous young nursery trees and remove the older trees entirely, but Mr. Barnhart says:

"If the bark of the trees will 'lift' bud them at once to whatever variety desired. They will 'take' and next spring when new growth starts, cut off the tops and the year following he will have a small crop of peaches. By this method he will be two years ahead on the game, and that too, at about a tenth of the cost, were he to grub the seedlings out and reset new trees."

Advertise Guineas.

I note you always quote guinea hens but never see any advertised for sale. Where can I get them?—Subscriber, Sulphur Springs.

We have inquiries for guinea hens very often, and yet as our subscriber says, no one seems to care to advertise them. They are used often as "watch dog" in the flock of poultry, and some are breeding them for their flesh. It doubtless would prove profitable for someone to take up the breeding of them and be able to supply this demand.

Tamworth Hogs.

Where can I buy Tamworth hogs?—Subscriber.

We haven't the name of a single California breeder of Tamworth hogs. If any of our subscribers are breeding them or have them for sale, we believe there would be demand created by advertising.

Suckering Vines.

Is it injurious to cut out suckers or unnecesssry wood at this time of the year? How many spurs should an old vine have?—Subscriber, Selma.

This is a case of too little information to give an intelligent answer. By the latter part of the question we suppose the inquirer is referring to his vineyard. It would have been better had the suckers been removed when a foot or so long early in the season. Thumb pruning would only have been necessary at that time. So long as they have remained to this time, we would wait until the vines are perfectly dormant, and remove the suckers at the time of regular pruning. As to the number of spurs and the length. It depends upon the thrift of the vine and the variety, especially the variety.

(Continued on Page 329.)

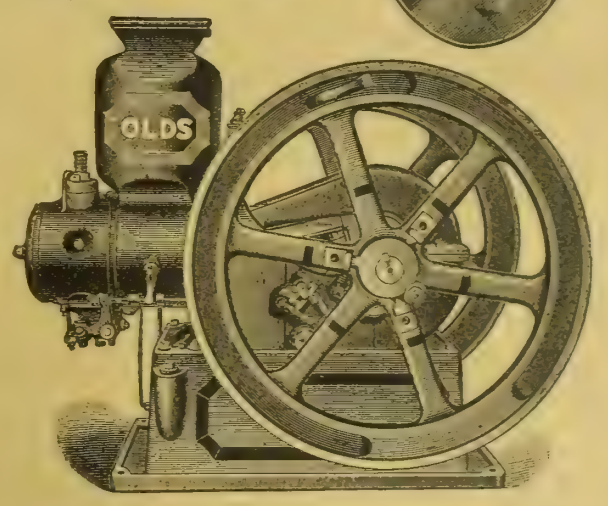
FREE this real leather bill fold for the Head of the Farm

(Not for boys—they're all right and their turn will come later—but this is for the boss.)

Thousands of farmers will buy gasoline engines this Fall and Winter. I want to get in direct and personal touch with every one of them, as I want them to know about the Olds Engine.

If you are going to buy an engine, or are thinking about it, you ought to know what an Olds Engine will do for you. I want to tell you about them—give you just the information you want—so if you will fill out the coupon below (or write me a letter) saying what size engine you want, whether portable or stationary, and when you expect to need one, without asking you to make any promise or obligating you in any way, *I will send you absolutely free* this genuine calfskin bill fold, stamped with your name in gold letters.

It will hold fifteen bills easily. When folded it will go in a small pocket. It is very convenient, handsome and useful; will last a lifetime. Has no advertisement on it.



OLDS GASOLINE ENGINES

are known the world over and used by farmers everywhere. They are the most satisfactory engine made for farm work. I guarantee them to do all we say they will—you to be the judge. Ask any man who has an Olds Engine. He will tell you.

We also make complete electric light and water systems especially for farms.

Write for our prices on corn shellers, corn huskers, feed grinders and cream separators.

If you are going to buy an engine, put a check mark (X) in the place showing the size and style engine you want, and when you expect to need it, and mail to me personally at once. Address me as below.

FARM LANDS FOR SALE.

LAND OPENING.
BLYTHE RANCHO.

Wonderful opportunity now to secure this valuable land with unlimited water supply at low opening prices and on easy terms.

10,000 acres of the wonderfully rich 40,000-acre Blythe Rancho, in the Palo Verde Valley, adjoining the Colorado River, are now ready for settlers.

Buy now at the opening prices. Buy forty acres. If you cannot handle that much, buy less, but if you can possibly arrange to do so, buy more. Take all you can at the opening prices, and you will never regret it. It is the opportunity of a lifetime. Over 100 miles of completed canals await you at Blythe Rancho—there is no waiting for water. It is there now in ample volume for every acre of land we sell.

Land is ready for settlers, soil is rich as the Nile—here you get several bouncing big crops each season—the soil is a fertile alluvial deposit, rich in vegetable mould, and needs no fertilization. Will grow anything from cotton and alfalfa to oranges and lemons.

Remember, low opening prices, $60 and $65 per acre, which includes all the water you can ever use. One-quarter cash, balance in one, two and three years, with 7 per cent interest on deferred payments.

Come in and see us and make arrangements to go down and see this wonderfully rich country, where big profits are soon to be realized. Personally conducted excursion trains leave Arcade Depot every Monday night at 10:15 for Blythe Rancho. Round trip tickets to Blythe in parties of three or more, $26.50.

Accompany us on one of these trips, or write for literature. Do it NOW.

PALO VERDE-BLYTHE LAND & TOWN CO.

Exclusive Agents, Phone F5270, 501 Higgins Building,

Los Angeles, California.

Office also at Blythe, California.

For Sale—Alfalfa Ranch. I will sell my twenty acres of highest class alfalfa land, all leveled, checked and seeded, in the best irrigated land section of Stanislaus County, near the town of Patterson. Close to fine schools and churches. Best market in the state for alfalfa, hogs and dairy products. Perpetual water right goes with the land. Low expense for water. There are no buildings on the land, but I only want $3,800 for it, and you can have it

For $850 Cash,

with the balance spread over ten years at 6 per cent. This is a great chance to buy right. Address Box "O," California Cultivator, Los Angeles, Cal.

DAIRY RANCH
FOR SALE.

430-acre river ranch of deep heavy loam, with good improvements, including fully equipped dairy; 110 acres of fine alfalfa, producing from four to five heavy crops; 60 acres of fertile upland, suitable for fruits, berries and alfalfa; 130 acres fine timber and feed land; 130 acres cleared bottom land, raising large crops of grain, all suitable for alfalfa or fruits.

This property is all well fenced and lies within 1½ miles of railroad station with ten passenger trains arriving daily. For price and terms apply to G. E. Brinkerhoff, owner, Modesto, Cal.

For Sale—43½ acres, 15 miles from Los Angeles, 5 miles southeast of Covina. Located on paved boulevard and 1 1-4 miles south of Baldwin Park. Close to electric and steam lines. Sandy loam soil and level. Twenty acres set to alfalfa, balance grain. Six-room California house, domestic well and windmill. Forty shares of best water stock in the valley and very cheap. This is a very desirable ranch and well worth your inspection. Price $450 per acre. One-half cash, balance easy terms. This locality is adapted to walnuts, oranges and general truck farming. Jos. Coleman, Room 412, First National Bank, Long Beach, Cal.

Lindsay District Orange Lands cost less money; produce more than any similar lands in the state. No scale, smut or diseases common to other sections. Crop marketed before the holidays, avoiding all dangers from frost. Ten acre tracts close to Lindsay, $150 per acre. Choice alfalfa lands, abundance of water, $50 and up. For information, call or write, Kious-Whann Realty Co., 235 Mason Bldg., Los Angeles, Cal.

For Sale—A 20-acre farm for $20 cash and $20 a month; possession now; $90 to $125 per acre; your crops pay for the land; rich, level land for alfalfa, oranges, almonds, grapes, cows, chickens; abundance of ditch water for irrigation for $1 an acre a year. Where else can you get this? In Oakdale Colony, near good town and railroad station. Climate delightful. T. Wiesendanger, 207 S. Broadway, Los Angeles, Cal.

For Sale— $20 Per Acre.

350 acres A-1 citrus, grain or stock ranch, 7½ miles south of Escondido, in line of new electric road now building, half mile from boulevard. Five-room house, barn, sheds, etc. Two orchards. Two good wells, two springs. About 225 acres under cultivation, about 75 more can be plowed, balance pasture. This is a bargain. Address Conrad & Company, Escondido, Cal.

Write me for particulars on one of the best orange, lemon and walnut grove propositions you ever saw. 237 acres. 60 acres planted, full bearing. Where water costs absolutely nothing, from the mountains in Temescal, near Corona, Cal. The water right is worth one-half the cost of the ranch. No frost or scale. $10,000 crop on trees. One six-room house. Two four-room houses, barns, etc. All stock and implements. Price $60,000, one-third cash, balance terms, 6 per cent. Jos. Coleman, Room 412, First National Bank, Long Beach, Cal.

10 Acres Rich Soil on Grand Avenue, 1½ miles from Escondido; good lemon or orange land. Price $1,250. Conrad & Company, Escondido, Cal.

RARE PLANTS

Wild Plant Improvement Gardens, Santa Ana, California. Newton B. Pierce, proprietor. Rare choice ornamentals and new fruits from all lands.

QUESTIONS AND ANSWERS.

(Continued from Page 327.)

If our subscriber will write again stating the variety of grape and their age, we will get from a practical vineyardist the information for him.

Pears Interset with Bartletts.

What varieties and what number is best for intersetting with Bartlett pears?—Subscriber, Santa Ana.

According to "California Fruits" the best pear to interset with Bartletts is Bartletts. It certainly is the favorite in the market. The book says:

"As very few varieties of pears are largely grown in California and as the Bartlett generally bears well when grown in large acreages by itself, the eastern claim that the Bartlett is self-sterile does not seem to be justified in California experience. Recent observations indicate that even at the East the Bartlett is self-fertile when conditions are favorable to setting of the fruit and self-sterile when they are otherwise. As conditions are usually favorable in California this may be the reason why its self-fertility is more conspicuous here than at the East. It has been individually noted, however, that the White Doyenne is a good fertilizer for the Bartlett."

Apple Trees from Missouri.

I am thinking of sending to a Missouri nursery for apple trees. Do I run any risk of having the package opened and examined every time the tree enters a new state or a different county? If so, would this not ruin them before arrival here?—Subscriber, Neenach.

There would be no examination of the trees in transit, but the railway company cannot deliver them to you until they pass inspection of your own county commissioner or his deputy. If they prove to be entirely free of any pest they will then be delivered to you. We believe we may safely suggest, however, that you will probably get better satisfaction and less trouble by dealing with coast nurserymen.

Fits.

I have a Rhode Island Red six months old which has fits. Sometimes it seems to be dying and then in a few minutes as well as ever. We feed them wheat.—Subscriber.

See Mrs. Basley's article in this week's issue.

Mildewed Grapes.

A subscriber near Whittier submits bunches of Emperor grapes badly mildewed. Bunches were well formed, some almost ripe before the attack began.

Mrs. Sherman recommends spraying with the lime sulphur solution before the vines start to grow the coming spring.

SALE OF GREAT STOCK.

On the first cover page is shown a photograph of one of the world's great cows. She with others, some bred in California and some imported from the world's best herds, will be offered at the Geo. A. Smith public sale at Corcoran, Kings Co., on Tuesday, Oct. 17th. Col. D. L. Perry, of Columbus, Ohio, and one of the best auctioneers in the United States, will conduct the sale. To make the merest list of great animals to be offered at this sale will be impossible in this column, but we may at least advise all who have any admiration for the beautiful Jersey, to write to Mr. Smith for his immense sale catalogue. It gives pedigrees of the animals to be offered with illustrations of many of them, and fullest information as to conditions of sale. It also gives engravings of some of Mr. Smith's Gold Medal winnings. Mr. Smith has had the nerve to import some great animals. It will be an education to attend his sale and see them, and incidentally we trust California livestock breeders will encourage just such men as Geo. A. Smith in the bringing of still more of this great stock to our State. It is the best way of building up its wealth.

FALL BULBS.

Theodore Payne, seedsman and nurseryman, at 345 S. Main St., Los Angeles, is now mailing his new bulb and fall flower seed catalogue. It is not large, only about 20 pages, and one fold makes it an exact pocket size, but it is chuck full of interesting information for the flower gardner. With the text are a number of beautiful little engravings showing some of the more desirable flowers. If the Cultivator is mentioned, we imagine a postcard might secure a copy of it by addressing Mr. Payne.

Anthrax Cure, Milk Fever Outfits. See O. J. Weber Co., 225-227-229-231 East Sixth Street, Los Angeles.

OUR HARROW SALESMAN SAYS:—
"The selection of a good harrow requires almost as much care as the selection of a good wife. There is no known rule by which all men can avoid getting poor wives, but you can avoid any possible harrow trouble by buying a "Sunshine."

You should send for our Free Booklet about Harrows. It may lead you to buy a

Sunshine Harrow

exactly suited to your needs and "Made Good" before you buy. You may also avoid buying a harrow which has to be "made good" after you buy it.

Newell Mathews Company

200-202 N. Los Angeles St. Los Angeles, Cal.

The Secret of Raising Plump Poultry

Over 18 years ago Dr. Hess set about tackling the problem of wasted nutrition—one of the drawbacks that cost poultry raisers thousands of dollars annually. After prolonged feeding and scientific experiments in his laboratory he introduced Dr. Hess Poultry Pan-a-ce-a, a preparation consisting of highly concentrated tonics, which enable fowl to extract the largest possible amount of nutriment from their ration and convert it into eggs, flesh, blood and feathers. In other words,

Dr. Hess Poultry Pan-a-ce-a

solved the digestion problem, carrying out "The Dr. Hess Idea" that the more food digested, the more went to the system-building and less to waste. At this time of year, when cholera is prevalent among poultry, Dr. Hess Pan-a-ce-a is particularly beneficial, as it strengthens and tones up the system and helps fowl ward off disease. It also cures Roup, Gapes and other poultry ailments and keeps hens in splendid condition for laying winter eggs. A penny's worth feeds thirty fowl per day. Sold under this guarantee:

Our Proposition

You buy Dr. Hess Poultry Pan-a-ce-a of your dealer. If it fails to make your hens lay more eggs and keep your poultry healthy, he is authorized by us to refund your money. 1½ lbs., 35c.; 5 lbs., 85c.; 12 lbs., $1.75; 25-lb. pail, $3.50. If your dealer cannot supply you, we will. Send 2 cents for Dr. Hess' 48-page Poultry Book, FREE.

DR. HESS & CLARK
Ashland, Ohio

Dr. Hess Stock Tonic A digestive tonic of great value. Especially helpful to hogs, helping them to digest more food and put on flesh very rapidly. Keeps the stomach clean—wards off cholera—expels the worms. It is a sure flesh and milk producer. 100-lb sack, $7.00; 25-lb. pail, $2.25. (Smaller quantities at a slight advance.) Sold under a written guarantee.

FREE from the 1st to the 10th of each month—Dr. Hess (M.D.,D.V.S.) will prescribe for your ailing animals. 96-page Veterinary Book Free for the asking.
Mention this paper and enclose 2c. stamp.

INSTANT LOUSE KILLER KILLS LICE

GAS! You Can Have It In Your Country Home **GAS!**

Or anywhere for cooking, heating, brooders, lemon curers furnaces or anything requirers heating.

More Efficient Than Wood or Coal

and gives immeasurable comfort and convenience.

How We Solve the Fuel Question

Wood and coal were efficient enough in our forefathers' days when the modern methods were unknown, but with its ashes, dirt, labor and inconvenience it is no longer giving that state of comfort and refinement so much sought after by the modern home, to say nothing of its scarcity and enormous expense. Would you be interested in a proposition whereby you are saved one-half your present fuel bill and given all the conveniences of a city home? Our home-made gas system gives you this. There is no smoke, soot, odor, noise, danger, ashes, dirt, building fires nor carrying fuel. Gives you quick and unlimited heat, pleasure, efficiency, economy, and convenience, and in short improves your home immeasurably.

Absolute Guarantee—Each and every outfit is covered by a positive guarantee.

If you are looking for these advantages, write for further particulars at once. Let us tell you what we can do for you.

DREAMING.

Dreaming, just dreaming, as bed-time draws nigh;
Waking dear memories as twilight rays die;
Thinking of days that are now long gone by;
Dreaming, just dreaming, that's all.

I see a farm house and the old red mill;
I hear the song of the weird whip-poor-will;
Tho' long ago, the picture haunts me still;
Dreaming, just dreaming, that's all.

Dreaming, just dreaming, I see home again;
Tho' it brings heart aches, it's worth all the pain;
In it is rest for my poor aching brain;
Dreaming, just dreaming, that's all.

It lets me wander as a child once more,
My friends return from that far-away shore;
From this dull earth my feelings heav'nward soar;
Dreaming, just dreaming, that's all.
—Harry Rowe Shelley.

FURNITURE AND LOVE.

"This is one of the most beautiful spots I have ever visited," said Grace, as she rocked idly in her chair. "The man who conceived the idea of building a hotel here should have a monument raised to his memory."

"Rather say that he should be permitted to live here forever," suggested Smithson lazily. "Why put him under the sod so quickly?"

"I meant when he dies, of course," amended Miss Hargreaves. She smiled brightly into the other's eyes, and, for the 100th time that afternoon, Smithson caught himself wondering why he had never realized before what a charming girl Grace Hargreaves was.

He had known her for years, but it was not until they found themselves among the first guests of the new hotel in the Restigouche region of New Brunswick that he had had his attention particularly drawn to her. The hotel had only been open two weeks, and guests were still few.

"How did you find the place?" he suddenly demanded.

"Mother wanted a new place," she explained. "Some men who hunted through here last year told her about the hotel that was being built and she insisted upon coming."

"I am here for old furniture," he volunteered. "There are all sorts of odd pieces to be picked up for a song. Their beauty lies in their genuineness; old bits brought out generations ago and used by their present owners who cast longing glances at the painted woods in the shops at Dalhousie."

Grace gave a little scream of delight.

"Do you mean to say that there are really places where you can still pick up old furniture?" she asked eagerly. "If I had only known! I shall have to telegraph for more money. Old furniture is a passion with me."

Smithson scowled, then smiled. He had hoped to have the rich field for himself, but second thoughts rather approved of so fair a rival.

"Suppose we pool issues?" he suggested. "In that way we shall not bid against each other and raise the prices. I'll buy it all up and when we get back to town in the fall we will have a division."

Grace nodded her assent and after being pledged to secrecy lest others learn of their plans, she ran off to confide her secret to her mother.

Smithson hired a team for a month and daily the three fared forth in search of treasure trove. The others at the hotel wondered at the long drives upon which Mrs. Hargreaves and her daughter went under Smithson's guidance, but none of the furniture they picked up was brought to the hotel and the nine-day wonder soon dropped.

Smithson picked up some wonderful bargains and had them all shipped to his town house. Before his vacation time was over he had skimmed the cream of the colonial collections in a ten-mile radius, but even the anticipation of unpacking his treasures did not console him for the fact that Mrs. Hargreaves had elected to remain for another month.

The long delightful drives behind the fast team had deepened companionship into love, and as he cleaned and polished his purchases with the painstaking care of a true enthusiast, each piece was a reminder of some little happening of the vacation.

He did not fully realize this until some weeks later, when at last Mrs. Hargreaves returned to town and Grace came to claim some of the spoil.

"I should like that old desk," she said, as she pointed to one of the acquisitions. Smithson's face clouded.

"I was hoping that you would not want that," he said. "That is a souvenir of our first drive."

"We got a lot of things that first day," she reminded, and then blushed as she remembered that moment when Smithson's hand had unconsciously dropped upon her own upon the desk. It had been only an instant, but it had stamped itself indelibly upon her brain.

She could not tell him that that was why she wanted it herself, and she wondered if that was also the reason why he wished to keep it. She passed on to other things, but each one had some association, and his forlorn expression as she made her choices touched her.

"I really hate to take any of these things away," she said at last. "There are no duplicates, and they make such a complete whole that it would be a shame to spoil it all by breaking the collection."

"That might be avoided," he said, bitterly, "if I had given less time to the collection and more to the promptings of my heart. It is not selfishness that makes me want to keep these things. It is because each has some association with that happy time. I look at that table and remember our lunch of bread and milk we made off its surface. It's the same way with everything else. Each piece reminds me of you and I am loath to give up even one tiny souvenir of that time."

"Is it really necessary to break the set?" she asked.

"You mean that—that you care for me?" he asked.

Grace nodded.

"No one but a stupid man would have needed to ask that question," she said softly, as she patted the desk affectionately.

His hand dropped upon the slim fingers lying upon the polished surface.

"We can make a very lovely home with these—and you, sweetheart," he whispered. "And to think that all this time I thought your interest was only the love of a collector."

"The love for a collector," she corrected, softly, as she yielded to the arm that slipped about her waist."—St. Louis Globe.

LAUNDRY ECONOMY.

Soft water, for use in laundry work, saves soap, clothing, time, energy and money.

Buying soap by the box is more economical than buying it by the quarter's worth.

Removing the soap from the box, and piling it in such a way that it will dry, causes it to wash away less rapidly, and therefore to last longer, than if not dried.

Having a firm, substantial wash bench, of a height suited to the worker, so constructed as to hold the tubs securely in position, saves time and energy.

A good stationary wringer, or one which is so made as to be clamped securely to the tub, is a necessity. When through using the wringer, loosen the screws to relieve the pressure on the rubber rollers; wash clean, wipe dry, and put it away where it will keep clean until needed. Occasionally cleaning the wringer with kerosene,

Natives digging and loading asphalt at Trinidad Lake

Genasco is the roofing of the age. Its foundation has stood for ages past.

It beats shingles. They warp, crack, split, and rot—more so now than ever before (lumber is getting scarcer, and shingle-quality is becoming poorer every year).

Beats tin, which rusts and needs painting regularly. And even with paint tin doesn't last like it used to—quality has deteriorated here, also.

Coal tar has the same old faults it has always had—gets soft and melts in the summer sun, and gets brittle and cracks in the cold, and leaks.

Genasco

the Trinidad-Lake-Asphalt Roofing

is the one roofing that lasts. It is made of Nature's everlasting waterproofer.

Trinidad Lake Asphalt has withstood the suns and storms of centuries; and in Genasco it gives the same lasting resistance to sun, rain, snow, wind, heat, cold—and even fire.

The oily nature of this natural asphalt keeps Genasco alive and strong to defend itself; and this is why Genasco is lastingly waterproof.

The Kant-leak Kleet waterproofs the seams of Genasco without cement, and prevents nail-leaks besides. It gives the roof an attractive appearance.

Ask your dealer for Genasco mineral or smooth surface Roofings with Kant-leak Kleets packed in the roll. Guaranteed, of course. Write us for samples and the Good Roof Guide Book.

For catalogue address Secretary, Mills College P. O., Calif

and then washing with soapsuds, rinsing and drying, tends to keep it in good condition.

The ironing table should be of a height suited to the ironer; not low enough to cause the worker to stand in a stooped position, nor so high as to necessitate the lifting of the shoulders while ironing.

The ironing pad and sheet should be perfectly smooth, and securely fastened to the table, if rapid, efficient work is to be done.

Irons should be of medium weight, smooth and clean. When through using the irons, remove them from the stove and set them on end in a dry place to cool. When they are cool, see that they are clean before putting them away. Irons that are left on the stove day after day are liable to be rough, dirty and unfit for use.

A slip for the ironing holder, made of some coarse white material, is convenient and desirable, because it can be so easily laundered.

Rub the iron, each time it is taken from the stove, on a piece of clean paper or cloth, before using, to prevent the possibility of soiling or scorching the article to be ironed.

A clothespin bag, which can be tied about the waist when hanging out or taking in the wash, saves many steps and keeps the clothespins clean.

A rope clothes line should be taken down when not in use, and kept in the clothespin bag, where it will be protected from dust and be handy when wanted.—Mary L. Bull, Extension Division Minnesota Agricultural College.

TO CLEAN DAINTY WOOLENS.

White corn meal is excellent to dry clean white or any delicate shade of woolen goods; also for cleaning knitted and crochet articles that are not quite soiled enough to be washed. The meal must be heated in the oven and the article rubbed through it as if washing in water, and there is nothing better for cleaning white furs than very hot corn meal, and the best way to clean them is to lay them flat on a table and rub the meal through every inch of the fur.

White angora hoods and furs that are only slightly soiled may be made to look as nice as new by rubbing them with flour. Put the article to be cleaned in a small sack and use about a pint of flour for one hood, then fold the sack and rub and press between the hands until the article is clean. The best way to clean a shawl to keep it in shape is to baste it to a piece of soft cloth before washing. They can also be made to look very nice by putting into a pillow case and then tying a string around the top and washing in plenty of hot suds. The article can be washed, rinsed and dried in the sack. There is no better way than this for washing baby sacques and caps, and all such dainty woolens, and after they are washed and rinsed they shold be hung in a warm place and the sack containing them turned and shaken often until the articles are perfectly dry.

Everything depends upon the soap used in washing woolens and there is nothing better than soap chip suds for washing all woolens, and this is prepared by dissolving some soap chips in hot water and then stirring in warm soft water until a nice lather is made. There is enough borax in the soap chips to soften the water and the articles are easily cleaned by pressing and squeezing between the hands. The all white woolens are improved by soaking in the suds, but colored ones should be washed and rinsed as quickly as possible. The Twenty Mule Team soap chips are excellent for washing the soft woolen blankets used on children's beds, and sweaters and caps are kept soft and of good color as long as they last by washing through these suds, but all the changes of water must be of the same temperature and they must be dried in a warm place. A little blueing can be used in the last rinse water for the all white goods, and a little dye of the same color as the garments for the colored goods.—Aline.

It is the quiet worker that succeeds. No one can do his best, or even do well, in the midst of badinage, or worry or nagging. Therefore, if you work, work as cheerily as you can. It is the pleasant word, the hearty word that helps.

Hay.

Scott, Magner & Miller say:

Receipts of hay for the week have amounted to 4050 tons, which is about the same amount that we received the week previous. The bulk of this hay arrived by water, and consisted very largely of alfalfa hay and some ordinary grain hay. There has not been much horse hay of good class coming by cars for the reason that there is so little comparatively left in the fields of such hay.

The grain market has advanced again, and both oats and barley are selling on a higher basis than at any time during the season. The fact that grain has advanced so steadily has naturally had an influence on the hay situation for good varieties of hay, and while our market has not as yet responded to these conditions to any extent, the feeling appears to be along these lines.

Do your cows milk hard? Send 50 cents for teat expander. O. J. Weber Co., 225-227-229-231 East Sixth St., Los Angeles, Cal.

Fancy wheat hay in 200-pound bales is now being taken from the warehouses to supply the current light demand for this class of retailing hay; such offerings command our topmost quotations. Fancy red oat hay is not being shipped in at present for the reason that all of this variety of hay is under cover and must be taken from the warehouses to supply any demand that requires this class of hay. It is unusual to see hay taken from the warehouses so early in the season, as all such hay must bear the high costs of warehousing.

Deciduous Fruit Market

F. B. McKevitt, general manager of the California Fruit Distributors, reports:

Sacramento, Cal., Sept. 30, 1911.

The following gives the number of cars of deciduous fruit shipped from all points in California for the week (seven days) ending Friday morning, September 29, 1911:

Peaches—25 cars. The peach movement during the past week has been about the same as for the preceding one. Principal supplies are coming from the foothill districts and from Vacaville. They will continue in fair supply for probably another week. Quality is particularly fine.

Plums—3½ cars. Scattering shipments are still offering, and may continue for a few days longer.

Pears—45¾ cars. Not quite as many cars shipped this week as last. The coming week will probably show still further reductions. Winter Nellis is the principal variety still available. Quality of fruit is first class.

Grapes—480¾ cars. Movement of grapes seems to be nearly stationary, as there has been practically no change during the past three weeks. Shipment from Lodi has dropped to very small volume owing to the very low prices prevailing. Quality of the output from this section has steadily improved from the beginning, and now seems as near perfect as it is possible for grapes to be. Abundant supplies are still available. Cornichons and Emperors are developing in first class shape and promise to be of better quality than before for some years. It is not likely that any appreciable quantity of either variety will be shipped until the Tokay movement is done.

Weather conditions continue favorable. Light showers fell in two or three sections of the State during the week. Grape sections have so far entirely escaped damage. Storms may be expected, however, at any time

Comparative statement of shipments for season up to September 23, 1911:

	1910	1911
Cherries	250½	216¼
Apricots	289¾	214½
Peaches	2502¾	1947¼
Plums	1552½	1353¼
Pears	2312	2088½
Grapes	2578½	2581½
Sundry	10	3¼
Total	9496	8404

Citrus Fruit Market

LOS ANGELES, Oct. 4, 1911.—The demand for Valencias is even better than last week, prices on regular sizes now running $4.25 to $4.50 delivered. The market is kept fairly well cleaned and the few yet remaining will be closed out at good prices before Nov. 1st.

There is no particular change in the lemon market but all offerings, even in the farther eastern markets, are quickly picked up at prices in advance of the foreigns.

Shipments.

Shipments of oranges since Nov. 1st, 1910, aggregate 36,233 cars; of lemons, 6,457 cars, or a total of citrus fruits of 42,690. To same date last season 24,898 cars of oranges, 4,601 of lemons, or a total of 29,499 cars.

NEW YORK, Oct. 2.—Seven cars oranges, one car lemons sold. Showers, unsettled weather.

Injury in Pasture.

If A has pasture with deep ditches running through it, and takes in stock from B, B knowing of those ditches, and B's stock is later injured, is A responsible?—Subscriber.

A is liable to B if he fails to use ordinary care to protect the stock of B from injury, but B is also required to be ordinarily careful in the selection of the place to put his stock, and if he knew the pasture was dangerous, I am of the opinion that he cannot recover from A for injuries resulting from the danger that B knew existed. —E. L. P.

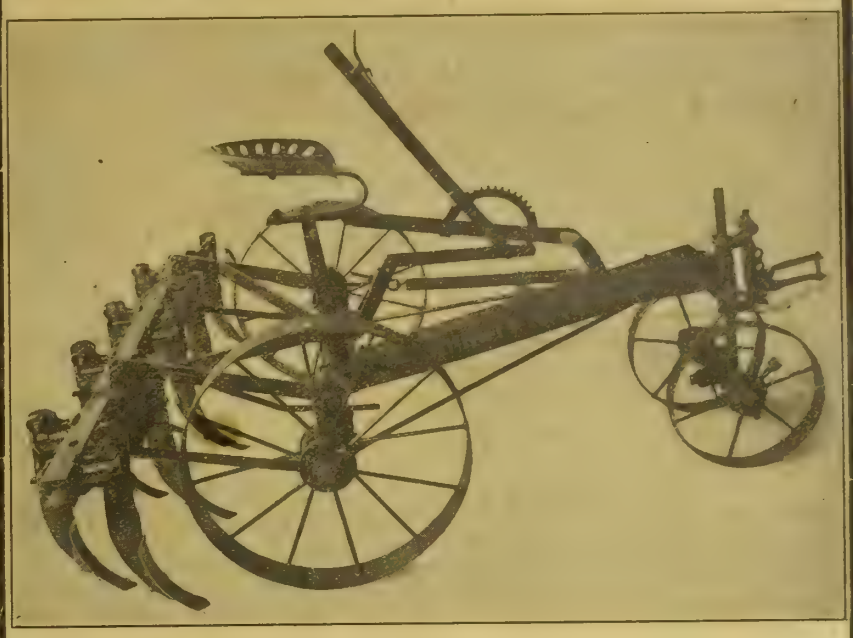
DRAFT HORSES.

(Continued from Page 320.)

then neglected all the rest of the year is not a good one. The horse should work the same as any other horse and made to digest his barley by the labor he does. Then too he is not a wild animal, but an affectionate beast that loves to be talked to and made much of. So do not tie him up in a box stall by himself. Good, sound hay should be the basis of his feeding and when on duty a mixture proportioned of a thousand pounds of rolled barley, five hundred pounds of bran and fifty pounds of oil meal mixed should be given as a feed. Begin by feeding him two quarts at a feed and increase it, but do not exceed twelve quarts a day at three feeds, as it is pushing him too hard. A cutting of green grass or a bran mash once a week will keep him in tone. The horse on feed like this must have at least ten miles of exercise a day or be worked in a wagon at chores. Never feed a draft horse and let him stand in the stable or he will go down to his death from overfeeding. There are few men that have owned horses that have not killed some by overkindness in feeding. The horse comes to the door and never did he look better nor did he frisk off more joyfully. A short quarter of an hour and the horse begins to sweat and roll in his gait, staggers and falls. In a short time his hind quarters are paralyzed. The horses rarely recover from this trouble and it is of quite frequent occurrence in the stable where good horses are kept. The poorer horses on the ranch are not as heavily fed and it is not long before some smart fellow will tell you that he does not wish good horses, as they are more delicate than scrubs. M. E. Sherman.

"Buy the Best Milk Producer in the world, sugar beet pulp at 50 cents per ton, of Los Alamitos Sugar factory."

The Arnott Improved Orchard Cultivator



WE are pleased to be able to announce that prompt shipments can now be made of the New Arnott Cultivator as shown above. This has been for years the most popular cultivator in the Southwest and with the New Fore Truck it is way in advance of any other orchard tool.

MAN MUST EAT
There is money in
SUGAR and CATTLE

Share in the profits of an agricultural investment, comprising over 21 square miles of rich agricultural lands.

The land has an abundance of water in a district where irrigation, drought and frosts are unknown. Large tame grass pastures have just been prepared.

The land is free from incumbrances, which affords our investors the highest degree of security.

THE PRODUCTS OF THE RANCH ARE CATTLE AND CANE SUGAR, TWO OF THE WORLD'S BIGGEST DIVIDEND PAYERS, AND ON WHICH THE MARKET IS STEADILY ADVANCING.

In this district lean cattle fatten in four months in tame grass pastures and increase 50% to 100% in value.

Cane sugar is manufactured at one-third the cost of beet sugar.

Additional capital is required for improvements and to buy cattle to stock the ranch. A limited amount of investment certificates will be issued in units of $100 cash or on installments. Six per cent per annum interest is guaranteed, and we also share the profits with you. Option given to withdraw your money and profits or to become a part owner of this great property.

Applications for certificates will be filed in the order received. This enterprise is backed by some of the most substantial and well-known business men of Los Angeles. We invite the strictest investigation.

Send for free booklets and descriptive literature.

C. E. Reed, Secretary
710 Grosse Building Los Angeles, Cal.

Spring Bolster Wagon

Sold under the broadest guarantee ever given with any wagon.

Ask Your Dealer to Show It to You or Write for Booklet Describing It Fully

Patents Pending

Ordinary Bolster Springs, when Fitted on a Common Wagon:

1st. They raise the bed too high, making it hard to load. 2nd. It is difficult to put hold-down irons on a wagon so equipped. 3rd. There is nothing to prevent the bed from lurching ahead when chuck holes are struck. 4th. The spring, until loaded to just about the right point, does not commence to give—a few hundred pounds past this point and they flatten down.

On Our Spring Bolster Wagon with Equalizing Device:

1st. The bed is no higher than on a gear without springs. 2nd. The steel bolster standards have holes for bolting direct into bed stringers—no hold-down irons are needed. 3rd. The brace from the front bolster to the reach prevents lurching. 4th. Spring acts at all times, empty bed, half load, or full load makes no difference. 5th. Price of gear with the springs built in is about the same as ordinary gear.

Fresno Implement Co., Fresno, Cal.

Give the Pomona Patent Pressure Gate a Trial

No rubber or wooden facing to rot or wear out. Absolutely water tight when closed. Locking mechanism is protected against rust or clogging with sand or dirt. Simple in construction. Cheap in price and as durable as solid iron.

THE LOCKING DEVICE is the simplest made, merely a tapering screw with split tapering nut socket. It locks the cover in any desired position or locks the faces, making an ABSOLUTELY WATER TIGHT JOINT.

TWO FOOT HANDLE FURNISHED WITH EVERY PRESSURE GATE FREE.

ALSO A FULL LINE OF CIRCULAR VALVES FOR ORCHARD AND ALFALFA IRRIGATION CARRIED IN STOCK.

Write for descriptive circular and price list.

A Winter Garden

Of course, we all know that green vegetables can be grown the year around in California. But to do this requires water for irrigation.

This is the season to plant garden. If you have a pumping plant of course you are busy. But if you haven't? Plant garden anyway.

We carry a stock of pumps in San Francisco and Los Angeles. By the time your garden is in, your plant can be running. The cost is not heavy. In fact, if you figure the saving and extra profit from your ranch, the pumping plant will probably be paid for the first year.

Come in and talk it over. Remember, we have been building pumps for thirty-seven years, and we mean it when we say

DOW PUMPS

will pump more water for less money, and do it year after year.

Pumping Plant

That You Can Depend On?

Then it must be one that is designed expressly to meet your requirements, every part proven by time and service in other plants to be perfectly adapted to do the work it will have to do in yours.

This company is not committed to any one type or system of pumping, but we know the pumps that have given satisfaction and what their working conditions must be, and by means of this knowledge, can take your case, consider all its phases, then outline a plant that we know is bound to absolutely meet your requirements.

Our price will be either f. o. b. Los Angeles, or as we would prefer, installed complete at your well and in perfect running order and doing just what we have told you it would do.

Write us your conditions fully or ask us to send you a card to be filled out. We will quote you a price, a good one, and remember it will cover a plant that you can depend upon.

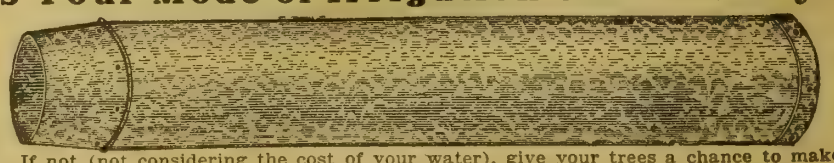
THE NAME IS A LUCEY GUARANTEE — THE NAME IS A LUCEY GUARANTEE

Is Your Mode of Irrigation Satisfactory?



If not (not considering the cost of your water), give your trees a chance to make good by giving your orchard the proper amount of water all over same, and not three-quarters of your water supply within forty feet of your head flume.

The surface irrigating pipe we manufacture will remove this obstacle—will cut your water bill—is more convenient to use and will last a life time.

Write us, stating your requirements and we will cheerfully furnish you with prices and information desired.

We also manufacture Ells, Tees and Gates for this special pipe and are in a position to manufacture any special fittings you may require.

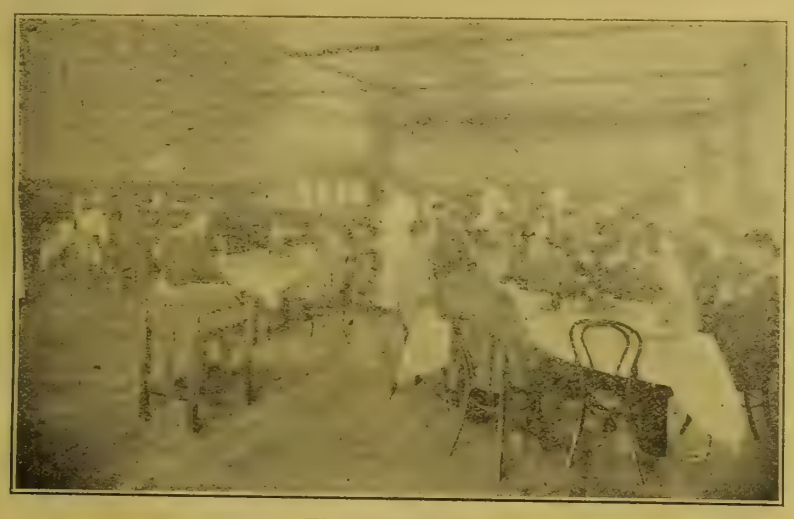
Vol. XXXVII. No. 15. LOS ANGELES: THURSDAY, OCTOBER 12, 1911 One Dollar the Year

Spending a Day in a Modern School

Not the One Surrounded by Mayweed, but One Far More Modern in Its Appointments. The State Polytechnic School at San Luis Obispo is a Credit to the State. Editorial Correspondence.

The dreary school house located on an extremely small corner of a pasture field, and around which there was neither shrub nor flower other than Mayweed, in which the writer learned his A B C's, was recalled one day recently when he was taken over the spacious grounds of the California Polytechnic School in San Luis Obispo. The recalling of old days was because of contrast, not similarity of condition. Instead of the cramped grounds barely affording room for the "gravel" building, the buildings, of which there are several, are located in extensive grounds of 310 acres. Instead of the Mayweed, cultivated flower-beds, well cared for lawns and even plants from the tropics in glass houses were shown. The 310 acres, however, are not all used to add beauty to the school grounds, but are of the greatest utility in that they were used to aid in the education of some 173 California young people during the past year. To be strictly correct, only a portion of the 173 have used the grounds, that is, while it is largely an agricultural school, many are taking mechanical work and many others in the girls' classes are taking special cooking or other manual training courses. This school was established by an act of Legislature in 1901, the government being vested in a Board of Trustees consisting of the Governor, Superintendent of Public Instruction, and five others to be appointed by the Governor. It is located on high grounds overlooking the little valley in which lies San Luis Obispo, and affording a view which is an education in itself. It is but a few miles from the Pacific ocean and almost perfect climatic conditions are given the year round. Adding to the beauty of the outlook the rolling nature of the farm itself gives opportunity for most beautiful effects in landscape gardening. These have been improved upon to a certain extent and will be more and more as the years pass. The rolling nature of the farm does not give the most typical farming conditions. However, there is sufficient level land for any practical experiment work needed by the students.

Judging Stock at the School.



The Dining-Room.

The writer was driven over the farm by Mr. I. J. Condit, Instructor in Botany and Horticulture. It was the day after graduation of this year's class, and the Director, Prof. LeRoy B. Smith, found himself in a mass of "unfinished business" which he was endeavoring to clean up. However, the keys of the farm were turned over to us and it was a most interesting day in which comparisons were made between methods of education today and 35 years ago.

There is a main administration and class-room building, household arts building, a girls' dormitory, boys' dormitory and a commodious dining hall, forming the central group of buildings.

In less sightly locations are placed the creamery, shops, laboratories, dairy barns, swine yards, poultry yards and horse stables. Pure bred stock is kept on the farm and methods of judging and care of the stock is taught by practical work under the supervision of thoroughly qualified instructors.

We may note one "class-room" in the household arts building which might impress some practical hard-headed farmer as somewhat superfluous in the scheme of modern education. The room was finished as a typical good-sized dining room in a modern home. A large dining table, sideboard with china, plate rails neatly decorated with other pieces of china, and cupboards filled with linens were the factors in the room. In this room is given practical demonstration of proper serving of a meal. Each girl taking the course in household arts is expected to entertain her classmates once each term at a course luncheon, and for that purpose this room is at her service. Her entertaining is under the direction of a competent instructor and she is taught the nicer little things in the art of entertaining. Other lessons given to the girls in addition to the "Three R's" and some of the sciences are free hand drawing, sewing and dress-making, domestic science, sloyd, millinery, gardening, home management, botany, etc.

It is practically a high school course but does not accredit to the State University, but it offers a most excellent opportunity for the young of the state for a practical education.

Entrance to the Farm.

Largest Citrus Nurseries in the World

If you contemplate planting of Citrus groves this season you should get our prices.

Citrus and Tropical Fruits

A GREAT ORGANIZATION.

The California Fruit Growers Exchange has become so much of a factor in California marketing operations that we often regard it as commonplace and in the regular order of things, but occasionally it is well to take a look at it from the standpoint of one not directly engaged in the citrus fruit industry, so we give a quotation from a daily newspaper showing how this organization looks to an outsider. The article appears in connection with report of an annual meeting and election of officers for the coming year. The paper says:

"Former officers have been reelected by the stockholders of the California Fruit Growers Exchange. The stockholders of the exchange are the 16 subexchanges, and they, in turn, are made up of the local associations.

"Each subexchange holds only one share of stock, and the California Fruit Growers Exchange therefore has outstanding only 16 shares of stock, at a par value of $100 each, and it pays no dividends; yet in the last year it handled fruit to the value of approximately $20,600,000.

"The directors chosen for the coming year are as follows: Representing the Associated Fruit Exchange, Highgrove, Josephus Hudson; A. C. G. Fruit Exchange, Azusa, W. C. Hendrick; Arlington Heights Fruit Exchange, Riverside, W. G. Fraser; Covina Fruit Exchange, W. M. Griswold; Duarte-Monrovia Fruit Exchange, Duarte, M. R. Williams; Ontario-Cucamonga Fruit Exchange, Upland, H. E. Swan; Queen Colony Fruit Exchange, Corona, S. B. Hampton; Ventura County Fruit Exchange, Santa Paula, C. C. Teague; Redlands-Highlands Fruit Exchange, J. S. Edwards; Riverside Fruit Exchange, A. P. Johnson; San Antonio Fruit Exchange, Pomona, Fred J. Smith; San Bernardino County Fruit Exchange, San Bernardino, E. F. Van Luven; Semi-Tropic Fruit Exchange, Los Angeles, F. Q. Story; Sunset Fruit Exchange, Orange, H. E. Huff; Tulare County Citrus Fruit Exchange, Porterville, K. H. Plate; Central California Fruit Exchange, Lindsay, D. G. Overall.

Alhambra Man President

"F. Q. Story of Alhambra is president of the general exchange, B. A. Woodford of Claremont is general manager and secretary, but he is not a member of the board of directors.

In the seven years that the exchange has been organized it has sold nearly 50,000,000 boxes of fruit for its members, bringing to them nearly $90,000,000, an average of $1.80 a box on board the cars in California, for the entire time. The following shows the amount handled by the organization each season and the aggregate and average returns per box:

Year	Boxes	Aggregate	Ave.
1904-5	5,188,511	$7,124,377	$1.37
1905-6	4,705,515	9,936,497	2.11
1906-7	6,149,708	12,268,752	2.00
1907-8	6,628,644	11,753,544	1.77
1908-9	8,710,828	13,958,990	1.60
1909-10	7,578,801	14,831,975	1.95
1910-11	10,842,831	20,579,560	1.89
Totals	48,804,838	$89,453,695	$1.80

Returns Not All In.

"The figures of the aggregate returns for the present season may vary a trifle, as the returns from recent cars sold are not all in, but the variation will be scarcely appreciable, if any.

"This total business of nearly $90,000,000 in seven years has been transacted with a loss of less than $6000 through failure to collect or in the transmission of funds—a remarkable showing. This is only one dollar out of every $15,000 worth of business, or perhaps two 2-cent postage stamps for each carload.

"The exchange also has done a large amount of subsidiary business incidental to the citrus industry. It has furnished the local associations with 2500 cars of box shook in the last year, or an average of eight cars for every working day in the year.

"Thin as an orange wrapper is, it required 150 carloads to supply the exchange last year. This would make more than a mile of freight cars filled with nothing but orange wrappers. The one item of nails to make the boxes would fill a solid train."

* * *

In this connection it may be in order also to give a bit of history of this great organization as published in the last year book of the Department of Agriculture. It was written by Mr. G. Harold Powell who referred to his connection with this organization as a great pleasure and an occasion for pride because it is making history in the handling of fruits as has no other organization in the world. This has been deemed worthy of reprinting and has been issued in a separate slip. The reference to the Exchange given below is only a small part of the year book article.

The Organization of the Citrus-Fruit Industry of California.

"The citrus fruit industry in California, which has developed commercially since 1873, when the Washington Navel orange, originally grown in Brazil, was sent to Riverside by the United States Department of Agriculture, represents an investment of 150 to 175 million dollars. The annual shipments of oranges and lemons have reached the enormous total of 40,000 to 50,000 carloads, with a value in California estimated to vary from 20 to 30 million dollars. Between 125,000 and 150,000 acres have been planted to citrus fruits, and from 100,000 to 150,000 people depend on the industry for a livelihood.

"The industry is localized largely in Southern California, though it is extending rapidly in the interior valleys to the north. No other horticultural industry in the United States of equal extent is so compactly located. None presents more difficult problems or requires a more skillful distribution and marketing of the crop. Oranges and lemons are distributed from California practically every day in the year for distances of thousands of miles to all of the important cities and towns in the United States and Canada, and some are exported to other countries.

"When the industry was small no complicated problems of distribution or marketing faced the grower. The fruit was sold for cash to buyers on the ground or to brokers who represented distant commission houses or other interests, or it may have been sent direct to a commission firm in some far-away city. As the industry grew larger and there were several thousand carloads of fruit to sell, the grower began to realize that the systems of selling the fruit already in operation were inadequate to bring to him the proportion of the returns which his capital was earning and to which he considered himself entitled. Under the system in operation there were frequent gluts in a few of the markets and apparently no effort among the buyers to equalize the distribution of the fruit geographically or throughout the year. The buyers were said sometimes to have fixed the maximum price which would be paid the grower and to apportion the citrus fruit area into districts so as to reduce competition among themselves. The result was disastrous to the producer and became so serious in the early nineties as to threaten to wipe out the capital invested in the industry.

"About this time the growers began to organize small associations for the purpose of preparing the fruit for shipment, and in order that it might be assembled in quantity and sold for cash or shipped as a unit. Mr. T. H. B. Chamblin, of Riverside, was the pioneer in organizing the citrus fruit growers in Southern California. The Pachappa Fruit Association was the first one formed, about 1888. A number of these growers' associations were soon formed, and in 1893 a plan was outlined by Mr. Chamblin, and finally adopted in principle, which federated a number of the associations and provided for the preparation of the fruit for market by the local associations, for the organization of district exchanges to be made up of the local associations, which were to receive orders for the fruit and apportion them among the associations, it being the

A Farmers Institute was held at Dos Palos last Friday and Saturday.

intent at that time to ship only such fruit as was sold before picking, and the formation of an executive committee, made up of representatives from the district exchanges, to market the fruit.

"Out of this federation grew the Southern California Fruit Exchange in 1895, and later, in 1905, the California Fruit-Growers Exchange, which now handles about 60 per cent of the citrus fruits grown in California. There are many other associations of growers not connected with the exchange which are organized on the same general principles, and these associations, together with the exchange and a few large growers who market their own fruit, handle about 85 per cent of the citrus fruit crop.

"In order that the principles which underlie the largest co-operative fruit-marketing organization in the United States may be understood, a brief outline of the exchange system follows:

"The California Fruit Growers Exchange represents about 6000 growers who have organized themselves into 100 or more local associations. The association usually owns its own packing house, where the fruit of the members is assembled, pooled, and prepared for market under brands adopted for the different grades by the association. The association usually picks the fruit of the members.

"The associations in the different regions combine into one or more district exchanges which represent the associations in the business operations common to each and which sell the fruit in co-operation with the California Fruit Growers Exchange through the district or local agents of the latter or at auction, receiving the proceeds therefor through the California Fruit Growers Exchange, an incorporated agency formed by a representative of each of the sixteen district exchanges, which acts as the selling agent for these district exchanges. The California Fruit Growers Exchange takes the fruit of the district exchanges after it is packed and with their advice places it in the different markets, sells it through its own exclusive agents to the trade or by auction, and collects the proceeds and transmits them to the district exchanges, which in turn pay the growers through the local associations.

"The central exchange, the district exchange, and the association all transact the business for the grower at actual cost. The central exchange through its agents is in daily touch with the markets of America, thereby enabling it to distribute its fruit intelligently. The local exhanges and the associations receive a daily bulletin from the central exchange which outlines the condition of all the markets the preceding day, states the selling price of all exchange cars, and gives the growers such information as will help them to pack and distribute their fruit to the best advantage.

"The limits of this article are too restricted to permit more than a brief outline of the battle that the citrus fruit growers of California had to wage for fifteen years before the co-operative principle was on a firm foundation. At first, the growers were inexperienced in meeting the attacks of those who are opposed to co-operation among the producers. Powerful financial interests of various kinds were arrayed against them and were organized to oppose them. Vicious attacks were made on the integrity of the officers. The results obtained by the associations were belittled, the growers' association contract was assailed in the courts, and the methods of marketing the fruit were attacked. The most determined efforts were made to show that the growers' associations were illegally formed. Finally the growers combined with the buyers at one time to market the entire crop, but this incongruous combination of producers and dealers was dissolved at the end of a year and a half.

"The history of the citrus industry in California is largely a record of the progress in the co-operative handling and distribution of the crop by the producer and of his determination to receive an equitable share of the value of the labor expended in its production. The battle has been won; the co-operative principle is firmly fixed. It is the balance wheel that gives stability to the industry and to the relations that exist between it and the agencies with which it transacts business.

The Night Before in the Apple Show

The State Apple Show at Watsonville Starts With a Rain Storm, as Did Last Year's. High Quality of Apples Shown, but Exhibits Not So Extensive as Last Year. Editorial Correspondence.

The exposition building is indeed a busy place. It is "the night before" and hundreds of hammers are knocking, but the workers are not, for they're too busy with finishing off their exhibits. The work is not so far advanced as last year on this day. The exhibits are not so extensive, but quality—uniformly higher quality—prevails. It's a beautiful show; much more so than last year.

There are only ten full car exhibits, while last year there were fifteen. But, say, did you ever see ten cars of apples, almost perfect apples, stacked up on exhibit? It's a sight. There is one car of Red Pearmains—beauties, every one—which makes one almost thrill at the sight.

But this is only an advance word. I will send Cultivator readers more particulars next week.

There are ten full carload exhibits, twenty 100-box exhibits, thirteen 50-box, twenty-seven of 25 boxes each, seventy-three of tens, 133 of fives, 187 ones, and 1,728 plate entries. Of evaporated apples there are 320 fifty pound box and 180 twenty-five pound box exhibits. There are nine barrels of vinegar and some cider, which is constantly decreasing by new "entries."

The features are good, twelve of them. I will write of them and send photos of them for next week's paper.

The judges begin work in the morning, for all are on hand. They are: Geo. E. Rowe, Grand Rapids, Michigan; R. A. Stanton, Hood River, Oregon; A. P. Batcham, Mosier, Oregon; C. J. Sinsel, Boise, Idaho, and J. L. Dumas, Pullman, Washington.

Deciduous Fruit Culture

APPLES IN THE MOUNTAINS.

By John Isaac.

No form of fruit production has made more rapid growth over the whole of the Pacific Coast during the past few years than has apple growing. In California this is especially true. In the early days in this state, it was confidently asserted by everybody who had never tried it, that apples could not be produced here—at any rate they were of such poor quality that they could not be shipped and were nothing "like those we used to have on the old farm at home." And we accepted these statements on faith, because everybody said so. But there were sceptics, and these set out apple trees in different places, and it was finally demonstrated that there were vast areas of land in California where the apple would do as well as anywhere on earth. In fact, we have discovered that there are two vast stretches of country in this state especially well adapted to apple growth; that along the coast and within the range of the modifying temperature of the ocean, and that in the mountains at an elevation of 2000 and upward to 4000 feet.

The apple, to give best results, demands a cool, moist locality. It will not do well in the hot interior valleys, for while, even here, some varieties will bear heavily, they lack the high flavor and good keeping qualities of those grown under cooler conditions. It is for this reason that the coast apples have gained a reputation for quality. They are grown within the influence of the modifying breezes of the ocean, where the atmosphere carries a deal of moisture. That the coast counties have become the greatest apple producers of California is due partly to their climatic advantages, the superior quality of their soil for apple production, but perhaps, more than either, to the fact that they are close to lines of transportation and within easy reach of the markets.

The mountain valleys are better adapted to apples than the coast, and we know that is saying a good deal, but they have been outside the sphere of railroad influence. In the mountains the winters are somewhat cooler than they are either in the lower valleys or on the coast. The summers are not so hot, and the soil, as a rule, carries more moisture.

We may safely assert that the finest apples on earth can be grown in the mountain valleys on the Sierra Nevada. Perhaps other sections can produce some equally as good, but there are none better, and it is, therefore, safe to claim that they are the best. It is the high colored fruit, too, that gives best results. There is some quality of the soil that gives this result, and the finest red apples we have ever seen are those produced in the mountain valleys. Added to this high color are superior flavor and keeping qualities.

Mountain apples have many other advantages over those of the valleys. In many sections codling moths are as yet unknown, and spraying against this expensive pest unnecessary. In some of the mountain valleys, however, it is found to a small extent, but we are assured by one of the most successful apple growers in the mountains that even where it has been established for many years, it is not a serious pest; not over three to five per cent of the fruit is wormy, and this even without spraying. Our informant ascribes this condition to the work of some of our parasites which are native to the mountain vegetation, but which do not do as effective work in the lower sections.

Early fruitage and heavy bearing qualities are also marked characteristics of the trees in these sections, and some fruit can be expected within three years from planting, while a paying crop is pretty certain within four years. As to the profits of a mountain apple orchard, the market reports frequently show that fruit from these sections will sell at $2 to $2.50 per box while other apples command but 75 cents to $1.

In these valleys all, except the tenderest fruits do well as, in fact, does all vegetable growth, but it is in the

apple that they excel all other localities, and it will be but a few years before California mountain apples will achieve a world-wide fame for their many superior qualities.

CROPS IN THE ORCHARD.

A question that is interesting and fascinating to the planter of fruit trees is this: Can the orchard be made to pay its own expenses up to the time of bearing without injury to future crops? If so, how? The answer we propose for discussion is, Yes, by means of well selected and well managed vegetable inter-crops.

Before we throw the question open, it might be well to outline some of the principles that govern the practice of successful inter-cropping in orchards.

To begin with, the grower must have a natural liking for the inter-cropping idea. One seldom makes a success of a practice that he does not like.

In the second place, care and attention needed by the orchard must not be detracted to other crops.

Third, the trees must not be robbed of plant food or moisture. Here we raise the most common objection to orchard inter-cropping, it being claimed that there is not enough for both. If we cannot supply plant food in quantities sufficient for the proper development of both crops, then by all means do not attempt to grow vegetables. Moisture is less easily controlled, but even here humus and cultivation are highly effective.

Fourth, we must not stir the soil late in the season, thus preventing proper ripening of wood by forcing it into new growth.

Fifth, we should choose crops that require but little outlay for special equipment, and which are light in their demands for labor.

Sixth, the question of markets and marketing must be considered with great care, for upon this the profits depend. In general, it is well to plant staple crops which may be sold always and everywhere.

Finally, we must consider the general adaptation of crop to orchard, having due regard for the lay of the land, soil conditions and harvest time.

With these points in mind, let us next consider the characteristics of the ideal crop for inter-planting. It is well to choose an early annual, of easy cultivation and ready sale. It should not be necessary to stir the soil late in the season in harvesting the crop.

Professor Stewart, of the Pennsylvania state college, holds that "From the standpoint of the trees, the least harmful are tilled leguminous intercrops, such as peas and beans, on account of their favorable nitrogen and moisture relations." Grass is generally regarded as highly objectionable, drawing upon the water supply of the soil. Early sweet corn is probably the best form in which to plant this crop. Melons, cabbage, tomatoes and early potatoes are used by many. But we must feed both the crops and the trees.—Paul Work, Cornell College of Agriculture, Ithaca, N. Y.

KEEPING CIDER SWEET.

The only satisfactory way we have ever found to keep cider sweet in kegs or bottles is to boil and skim it, canning it when at the boiling point and sealing securely. We have tried at different times such things as acids said to "keep it exactly as it was the day it was made," and have experimented with such preparations as horseradish and mustard seed, but found them all worthless. We like the taste of boiled cider and it is safe from alcohol when one wants it for mincemeat or for table use in the winter. We cannot say that it is as good as the fresh product, but it is safe and we use it freely. We simply bring it to a boil as soon as it comes from the press, skim and seal it in bottles or jugs and set it away in a cool, dry place. It keeps perfectly.—Farmer & Breeder.

And still thoughtless individuals will keep on throwing lighted matches into inflammable substances—as if it was really a difficult and expert achievement to blow out a match before throwing it away.

RAISING HOGS IN THE SACRAMENTO VALLEY.

By H. L. Murphy.

The raising of swine in the Sacramento Valley offers a better opportunity to the man with small capital than any other industry. The man with a few acres may keep his hogs as well as the man with a thousand acres.

Give them an alfalfa pasture or alfalfa hay and a small ration of grain and most important of all, plenty of fresh water and a clean place to sleep. Don't expect to raise hogs successfully and let them wallow in mud and drink stagnant water, or they will soon have hog cholera. Did you ever stop to think that the hog's digestive organs are nearer to those of a human being than those of any other animal?

The fruit grower can keep several hogs in connection with his orchard or vineyard at little cost and big profit, as well as the man who raises hay or grain, as he can run his hogs on his stubble after harvest and finish on grain in the pen if he likes. But the most profitable way to raise hogs for market is in connection with a dairy where you have plenty of skimmilk, as there is nothing equal to milk to make pigs grow. In addition, give them alfalfa with a little grain. For raising brood sows or breeding boars I would much rather feed a grain and alfalfa ration than milk and alfalfa, as at two years the grain-fed sow will be the better. A hog at seven months should be ready for market and weigh 200 pounds. The profit lies in putting them on the market young at small cost of producing the weight.

MALTA FEVER IN TEXAS.

The United States Army surgeons who have been investigating Malta fever in Texas give the conclusions of their work in a recent number of the Journal of the American Medical Association. They find that the disease exists in the goat raising sections of Texas. About 20 per cent of all goats examined were found diseased. All cases reported gave a history of association with the goat raising industry, and six gave a history of drinking goat milk. A large number of these goats are direct descendants of goats imported from Asia Minor and South Africa, where the disease has been proved to exist in goats.

While many of the cases give a history of drinking goat milk, the factor of dust infection must be considered, particularly in the Nueces River Canyon, where goat milk is rarely used, but where the houses are surrounded by the dusty bedding grounds of the goats and the disease is not infrequent.

At this time of year (September) conditions are very unfavorable for the study of this disease. They believe that a statistical study of Malta fever in Texas in man and goats should be made in the months of March, April, May and June. This period embraces the kidding season and the time when the goats are in full milk. After this time the goats rapidly become dry. The great majority of cases of Malta fever among the ranchmen are contracted also during this season, when the whole family practically lives with the goat herds, caring for the kids and teaching them to suckle.

YELLOW SKIN OF THE GUERNSEY.

As is well known the Guernsey breed of cattle give milk and butter of the highest yellow color of any breed. Next comes the Jersey, a sister breed on a neighboring island. The Guernsey people set great store by this feature of high color and they have a perfect right to do so. But much serious discussion is had among the Guernsey breeders as to the best means of keeping up this desirable feature.

In a blind, general way they are told to "breed for it." But that is not enough. It will be useless to breed for a thing if afterward the thing is wasted and through wrong environment and wrong ideas of feeding that which went in with the breeding goes out because of wrong conditions. We undertake to say that not one winter stable in a thousand is light enough to enable the cow to keep up the yellow color of her milk.

What are the causes of the yellow color in milk? (1) The yellow pigment in the cow herself. If she has it the milk will show it.

(2) The greatest abundance possible of light. In summer all cows show more color in their milk than in winter, for the reason, partially, that they are exposed to more sunlight than in winter. The sun is the source of all color.

(3) The greenness of the food consumed. In winter the cow consumes food the color of which is bleached out. In summer the grass is of the deepest green. The inference is easy, that if the farmer wants his cows to give yellow milk he should keep them in a thoroughly well lighted stable and feed forage of a green color.

In London, the butchers require that all veals shall be fattened in the dark in order that their tallow shall be white. Many a farmer has bleached out his cows in the same manner by keeping them in a dark stable.

Alfalfa and clover hay cut when it is greenest and cured in the cock under caps will help wonderfully to keep the milk yellow.

The Guernsey breeders, of all men, should have the best lighted stables and the greenest hay in order that they may preserve in their cattle the yellow pigment established by nature. It will be useless to breed for this yellow color if environment and feed do not reinforce and supplement the breeding.—Hoard's Dairyman.

COTTONSEED MEAL FOR HORSES.

The Pennsylvania Agricultural College made some interesting experiments upon feeding horses cottonseed meal and silage. The object was to determine the value of silage to horses and to compare cottonseed meal to oats in the rations.

It was found that cottonseed meal is an excellent source of protein for finishing horses and is more economical than oats. It was also found that the horses fed cottonseed meal retained the bloom and finish better than when oats were used as a source of protein.

There were seven horses in the

A Cheap Succulent Feed

Alfalfa hay is a wonderful feed, but like any other dry feed it is improved if used with a succulent feed. Dairymen have long realized that they needed something to go with their alfalfa, but have not been able to get it at any reasonable cost; so the majority have continued to feed just alfalfa, with perhaps a little bran or rolled barley.

Now is the Opportunity

You can balance your ration with appetizing, succulent Steam-Dried Beet Pulp—cheaper and better than any mill feed or grain, it makes an ideal combination with alfalfa hay—cows relish it keenly, and thrive on it splendidly. It can be used in the ration to replace an equal amount of mill feed or grain, or to replace *one and a half* times the amount of alfalfa hay.

It is the milk-producing qualities of Steam-Dried Beet Pulp which have made it famous. 8 lbs. daily, fed with 15 to 20 lbs. of alfalfa hay, forms a properly balanced ration for a thousand-pound-cow, giving about 30 lbs. of milk daily. You can safely figure on this ration to give you one to two quarts more milk every day from each cow—that means 3 to 6 cents every day from each cow. It's easy money, that you can get without the least trouble or risk.

It is also a splendid green feed for poultry. They are extremely fond of it.

Be Sure It's Steam-Dried

Steam-Dried Beet Pulp is the beets of the sugar factory with only the sugar extracted—and then *dried by steam.* The wet beet pulp has long been favorably known for its feeding qualities, but it is inconvenient, costly and objectionable to handle. When the beet pulp is *steam dried* it is packed in 100-lb sacks, and will keep for an indefinite time without spoiling. Steam-Dried Beet Pulp is always uniform in color and quality, never burnt or blackened by smoke, always clean and pure. Ask your dealer about it—or write us.

group, and they were divided into three groups according to weight and age.

Group one ate an average of 9.2 pounds of shelled corn, 8 pounds oats and 17.7 pounds mixed hay; the average daily gain was 1.64 pounds at a cost of 28.8 cents per day each, or 17.5 cents a pound of gain. Group two was fed 13.1 pounds corn, 1.5 pounds cottonseed meal and 18.1 pounds hay daily. The gain was 1.78 pounds, the cost of feed for each horse 24.8 cents, or 13.9 cents per pound of gain. Group three was fed 12.3 pounds corn, 1.4 pounds cottonseed meal, 10.4 pounds of hay and 17 pounds of silage; the daily gain per head was 1.6 pounds; it cost 21.5 cents daily per horse, and 13.4 cents a pound of gain. The estimate was based upon corn at 50 cents a bushel, oats 40 cents per bushel, cottonseed meal at $30 a ton, hay $12 a ton, and corn silage at $2.50 a ton.

It is of interest to note that silage, which is not usually considered good feed for horses, was used with good results, and when fed in connection with cottonseed meal made the gain per pound cheaper.

It is now a matter of general information that cottonseed meal is one of the cheapest and best sources of protein for work animals, and it should be more liberally used for this purpose.

GOVERNMENT BUYS MORE MORGAN HORSES.

The Bureau of Animal Industry of the United States Department of Agriculture has just purchased in Meade County, Kansas, four additional horses for use in the government breeding work that is being carried on in Vermont with the object of preserving and improving the Morgan breed. These animals are the seven-year-old Morgan mare Fanny P. (Vol. III, A. M. R.), two yearling fillies by Headlight Morgan (a son of Ethan Allen 2d), and a colt foal out of Fanny P. by Headlight Morgan. One of the fillies is out of Fanny P., and the mare is again in foal to Headlight.

Fanny P. is by Julian Morgan, the sire of Roy Morgan, champion Morgan stallion at the principal state fairs of the Central West in 1910. Fanny P.'s dam was by Flying Morrill, and her second dam by a son of Billy Root.

The pedigree of Headlight Morgan is well known to Morgan breeders. The horse was foaled in southwestern Kansas and has a well-deserved reputation in that vicinity as a sire.

These horses are among the descendants of a large consignment of selected animals purchased in Vermont and Illinois in the early nineties by the Morgan Horse Company of Carpentersville, Ill., and sent to southwestern Kansas to take advantage of cheap pasture there. Unfortunately, however, and partly on account of the depression in the horse market several years ago, the venture was not a success, the company disbanding and the horses being scattered over a wide territory. Some of this stock still remains in Kansas and Oklahoma.

The La Verne Rotary

Is the Best

Cultivator

You can Buy

The La Verne Rotary Cultivator carries no soil with it. Can be used at a greater depth and with less draft than any other cultivator on the market. Works close to the ground. Has no wheels or attachments to catch limbs or tear off fruit. Can be used close to the trees where other tools do not reach.

Farmers and orchardists using the La Verne Rotary Cultivator place their irrigation periods from one to two weeks further apart, as the La Verne leaves the soil in condition to absorb more water and to retain the moisture for a greater length of time.

The La Verne rotary action does away with the dragging motion on the ground, preventing the formation of "cultivatorsole" and permitting the water to reach a depth where it does the most good. Write or call on us direct if your dealer cannot supply you.

We make special tools for handling special work —tell us your troubles, we invite correspondence

BREEDERS' SALE

160 Head Percheron Mares and Colts

Two miles west of Gonzales, Monterey County, 12 miles north of Soledad, 20 miles south of Salinas. Teams will meet all morning trains at Gonzales.

One hundred head fine Percheron brood mares, 4 to 8 years old, weight from 1250 lbs. to 1600 lbs. each. Many well matched spans, practically all sound and in first-class condition, all choice brood mares and work stock.

Thirty head of fine 2 and 3-year-old Percheron colts; 30 fine yearling Percheron colts, above colts sired by imported Percheron horses.

Three pure bred imported Percheron stallions, one grand champion at the State Fair last year, the other two are ton stallions. One 5-year-old Kentucky jack; his colts will be shown day of sale. Six head of good milk cows.

All farm implements, including gangplows, cultivators, buck rakes, mowers, hay rakes, hay stackers, farm wagons, new 15-h. p. Fairbanks gasoline engine, feed cutter, Dozier feed mill, blacksmith outfit complete, 70 sets work harness, buggies, breaking carts, spring wagons, etc.

Mr. Cooper is one of California's prominent breeders and on account of having taken extensive holdings in the famous fertile valley of Yuma, Arizona, irrigation district, has instructed us to close out all of his stock, implements, etc., positively to the highest bidders, without reserve. Buyers looking for first-class brood mares and work stock should not fail to attend this sale. Old fashioned free barbecue at noon. The big horse sale of the year.

C. P. Cooper, owner and breeder.

PARCELS POST.

Obeying request for a statement as to "What Is Parcels Post," we have written Mr. Edward Berwick of Pacific Grove and from him have the following as to the aims of the League:

The widest possible extension of the sphere of the U. S. postoffice, so that it may afford the American public those postal facilities that are always enjoyed by old world lands and by the Republic of Mexico.

All interested in the progress and prosperity of the country are invited to become members. Lend a hand! There is no advance without effort. Send your names and subscriptions to John S. Dore, Treasurer, Fresno, Cal.

In Germany Beneficial.

The German postoffice for 6 cents transmits 11-lb. packages for 46 miles, and for 12 cents the same packages can be sent a possible 1500 miles; 110 pounds costs 60 cents for 46 miles.

Great Britain.

Great Britain has a special rate to farthest India or Burma; 3 lbs. for 24c; 7 lbs. for 48c; 11 lbs. for 72c. Half around the globe this particular mail is carried at little more than one-third of our local domestic rates. 11-lb. parcels are delivered in Abyssinia for $1.08.

Mexico.

A Mexican sends 11 lbs. to Algeria for 40c, (American money); to Belgium for 35c; to Holland for 35c; to Zanzibar for 60c.

United States.

The lowest domestic rate at which the United States postoffice will send parcels of merchandise is 1c per ounce, and no package must weigh over 4 lbs., excepting a printed book. The limit is 4 lbs. for 64c. The same 4-lb. package can be sent as far as London, England, for 48c; 16 cents less than from San Francisco to Oakland. This of course is too ridiculous. The reason is that, while the president and postmaster general control foreign rates, congress dominates domestic postage, and the transportation companies dominate congress.

What transportation companies can profitably do is exemplified by the fact that the express companies are now carrying for the British postoffice all parcels up to 11 lbs. weight between New York and any city in the Union, for 24 cents each.

The system has been in such successful operation in Britain for over 20 years past that in 1910 the British postoffice handled some 120,000,000 parcels and the gross profit on her mail service was about $25,000,000. Germany handled some 160,000,000 parcels and the profit on her mail service is about 53,000,000 marks (near $13,250,000).

In 1880 the Universal Parcels Post Union was formed between some 230 different governments for the transmission of international parcels. The United States did not become a party to this union, and has postal conventions with only some 40 out of the 230 above mentioned, those being chiefly West Indian islands.

Does it not seem to you desirable that Americans should be permitted to avail themselves of such advantages? Do you not think that what the German postoffice can do for the German, the British for the Briton, the Mexican for the Mexican—do you not think the United States postoffice should be able to do for the American? If not, why not?

As there are at present at least 40,000 more postoffices than express offices in the United States, those sending packages will have a more complete service.

The farmer can send his produce in small quantities direct to the consumer at small cost and better profit.

The storekeeper will be enabled to replenish his stock more frequently and quickly, not having to meet expensive express charges. Not being obliged to keep on hand large quantities of goods he can have a greater variety.

Delivery of goods to purchaser will be greatly facilitated, and in many cases with more economy than by private wagons, especially in suburban and rural districts.

Parcels Post presents so many advantages that in countries where it has become an established institution, so general is the satisfaction given that any one who would advocate its abolition would be regarded as insane.

THE SANITARY PRIVY.

Of great importance to human life is good health, which cannot be preserved if the sanitary conditions in and about living quarters are bad. Among the worst conditions to be found about any home is a soil that has become polluted. The secretary of agriculture has published a bulletin which treats of such soil pollution and certain simple plans for avoiding it.

Soil pollution by human excreta endangers the health of a family. It is possible by the expenditure of a few dollars for a sanitary privy to prevent this soil pollution, enabling the family to live, year after year, on the same premises, without endangering its members' health.

A number of widely prevalent diseases have been spread by means of polluted soils, simply because the facts have not been widely known, and it is to bring needed information on this subject to the dwellers on all farms and the residents of every village without a proper sewerage system, that Farmers' Bulletin 463 has been issued, and is now ready for distribution to anyone who makes application to either the secretary of agriculture, a senator, or representative in congress.

Full information, with illustrations, estimates of cost and plans for constructing the sanitary outhouses, is contained in the pamphlet. Directions are given as to how to keep a privy sanitary and how to properly dispose of night soil.

"In the United States about 400,000 persons suffer from, and about 35,000 die from typhoid, each year; over 2,000,000 persons have hookworm disease. Thousands of these deaths and many thousands of these cases of disease might be prevented by the use of sanitary privies."

"Although there may be no soil pollution upon one's own premises, his children may be exposed to all the dangers at the schools which they attend, and the entire family may be so exposed when they attend church, unless these schools and churches are provided with these sanitary conveniences. Lack of sanitary privies on neighbor's farms may also be responsible for cases of typhoid and infections on farms which are provided with proper outhouses, because disease germs may be carried for considerable distances by flies, by animals, by the feet of persons, by wagon wheels, and by drainage from one farm to another."

"In view of these well-established facts, it is evident that among the highest duties that rest upon a farmer, or dweller in a country village, is not only to have a sanitary privy on his own premises, but to insist that the pollution of soil be prevented throughout the entire neighborhood."

THE SEVENTEEN-YEAR LOCUST.

The seventeen-year locust visits these parts again this season, and we hope he will be able to see improvement in our world since his last inspection of it. He is a curious little beast and needs to be explained. What is the reason of him? What is he good for? Why is his period so peculiar? They tell us that down South his period is shorter and his visits come every thirteen years. That suggests that he may have been originally designed for equatorial life, or something still hotter, and meant to hatch out annually, but grew dilatory as his habitat cooled.

Perhaps he is a parable, and intended to suggest how often legislatures should meet.

He should be expounded and explained. We would like to know, for example, what conclusions about him

Brightest, Strongest and Best

You need the most powerful and reliable light you can get when loading the wagon for market in the early morning.

Rayo lanterns are the most powerful and reliable lanterns on the market.

They do not flicker, but burn with a steady, brilliant light. They will not blow out. They are economical, because, besides being moderate in price, they give you the greatest light value for the oil they burn.

Rayo lanterns are made in numerous styles, sizes and finishes, to suit any use. Best material and workmanship. Simple in construction, yet reliable and strong.

All Rayo lanterns are equipped with selected Rayo globes—clear, red or green, as desired. Wicks inserted in burners, ready to light.

Dealers everywhere; or write for descriptive circular direct to any agency of the

would be reached by Chief Justice White and his brethren after they had turned him over in their minds for a while, and whether Justice Harlan would concur. He seems to be something outside of the common law, with a rule of his own, and punctual in his response to its demands. The puzzle is to discover how he and his rule are related to the common law of nature. He is probably related in some way. The Creator seems to have indulged a considerable range of taste in the creatures with which He has furnished this earth. Some of them seem to have been made for fun—toucans, for example, with their extraordinary colored bills like comic false noses, and the blue mandrils in the zoo, with their bright red and blue tints and amazing ugliness! But most of the creatures conform to a general plan, but these seventeen-year locusts are irregular.

How very much there is that we don't know and can't explain, and how uncommonly good the guessing continues to be for minds that are keen enough to be intelligently inquisitive! —Harper's Weekly.

INSURANCE AGAINST AGRICULTURAL ACCIDENTS IN DENMARK.

The problem of insurance against farming accidents is still on the board in France, Italy, Russia, Switzerland, and many other countries. It has already been definitely solved in Denmark, on the contrary, by the law of May 27th, 1908, which makes the insurance of all persons concerned in agricultural labors obligatory, as well as those engaged in forest or gardening occupations, provided that their salary is not more than 1500 crowns (2100 frs.) per annum.

The Danish law, as explained in an article in the Bulletin of Economic and Social Intelligence for June published by the International Institute of Agriculture, does not take into consideration simply the accidents to workers attached to agricultural machines, as is the case with the majority of the laws of other countries, but includes also all the accidents during work, no matter what be their cause (handling of labor implements, transport of material, animals assisting in the labor, etc.).

The employer is responsible for the insurance, but he is free to insure with the society that he prefers, whether it be a mutual aid society or a share company, provided it is authorized by the ministry. We may remark that amongst the share companies which deal in this branch of insurance in Denmark there is an English and a Swiss company.

If the accident should cause a temporary disablement for work the person insured has the right, starting from the 13th week of disablement, to a daily compensation of 1.05 frs. for workmen less than 18 years of age, and 1.65 frs. for adult workmen. During the first 13 weeks the claim for the accident is defrayed by the sick funds. If the disablement is permanent and complete, the compensation paid is equal to six times the annual wage, the limit, however, being 3600 crowns (5000 frs.). Lastly, in the case of death the heirs receive compensation equal to four times the annual wage, but not more than 2500 crowns (3500 frs.)

The figures show that the compensation paid for disablement (409 cases in all) in 1910 was about 500,000 frs. that paid for deaths being 150,000 frs. In Denmark slight accidents are much more numerous than are serious ones; in fact, whereas in 1910 there were 313 accidents in which the disablement for work was less than 25 per cent, there were only 7 in which the percentage was more than 75.

How to take one's recreation with an automobile along the road is told by Thaddeus S. Dayton in the current number of Harper's Weekly. Any sort of automobile on which a hundred pounds of luggage can be carried can be used as a camping vehicle, says this author. "A tent big enough for two, food for a week, blankets for a bed, a rifle, and an axe will weigh less than a hundred pounds. With such an outfit, strapped on the back of the automobile, you can camp from one end of the United States to the other."

113 MARKET ST. SAN FRANCISCO CALIFORNIA

MAN MUST EAT

There is money in

SUGAR and CATTLE

Share in the profits of an agricultural investment, comprising over 21 square miles of rich agricultural lands.

The land has an abundance of water in a district where irrigation, drought and frosts are unknown. Large tame grass pastures have just been prepared.

The land is free from incumbrances, which affords our investors the highest degree of security.

THE PRODUCTS OF THE RANCH ARE CATTLE AND CANE SUGAR, TWO OF THE WORLD'S BIGGEST DIVIDEND PAYERS, AND ON WHICH THE MARKET IS STEADILY ADVANCING.

In this district lean cattle fatten in four months in tame grass pastures and increase 50% to 100% in value.

Cane sugar is manufactured at one-third the cost of beet sugar.

Additional capital is required for improvements and to buy cattle to stock the ranch. A limited amount of investment certificates will be issued in units of $100 cash or on installments. Six per cent per annum interest is guaranteed, and we also share the profits with you. Option given to withdraw your money and profits or to become a part owner of this great property.

Applications for certificates will be filed in the order received. This enterprise is backed by some of the most substantial and well-known business men of Los Angeles. We invite the strictest investigation.

Send for free booklets and descriptive literature.

CONTENTS THIS WEEK

VIEW OF FITCH MOUNTAIN AND RUSSIAN RIVER, Cover.

SPENDING A DAY IN A MODERN SCHOOL, 337.

CITRUS AND TROPICAL FRUITS.—A Great Organization; Lemon Increase; 338, 339, 357.

DECIDUOUS FRUIT CULTURE.—The Night Before the Apple Show; Apples in the Mountains; Crops in the Orchards; Keeping Cider Sweet; 340, 341.

LIVESTOCK AND DAIRY.—Raising Hogs in the Sacramento Valley; Malta Fever in Texas; Yellow Skin of the Guernsey; Cottonseed Meal for Horses, Government Buys Morgan Horses; 342, 343.

GENERAL AGRICULTURE. — Parcels Post; Sanitary Privy; Seventeen Year Locust; Insurance Against Agricultural Accidents in Denmark; 344, 345.

EDITORIAL.—The Nut Growers; Ripening the Date; Too Much for His Money; Conservation Congress; Malta Fever; Save the Files; Municipal Forests; San Diego Show; Olmstead Retires; New York Land Show; Dollar Fifteen Rate; Protection on Fruits; Watch Your Credits; 346.

AGRICULTURAL NEWS NOTES OF THE PACIFIC COAST. — Northern; Central; Southern; The Coast; 347.

PROFIT IN THE POULTRY YARD.—Biggest Poultry Problem; Kerosene Emulsion for Vermin; Liver Trouble in Fowls; California Poultry Shows; Alfalfa for Poultry Yards; 348, 349.

IRRIGATION AND FORESTRY.—Florida Methods of Irrigation; Growing Locust Trees From Seed; 350.

QUESTIONS AND ANSWERS.—Bee Moth; Teat Injured; Veterinarian Wanted; Cutting Eucalyptus; Dip for Hens; Hints; Ants in Orchard; Sugar Beets for Stock; 351, 353.

VETERINARY.—Forearm Cut; Fistula; Eye Trouble; Cough; 353.

HOUSEHOLD DEPARTMENT. — The Book of Memory; Philip My King; 354, 355.

PRODUCE MARKET.—Los Angeles Market; San Francisco Market; Deciduous Market; Citrus Market; 356, 357.

THE NUT GROWERS.

The National Nut Growers Convention was held in Mobile, Alaama, last week. The association is busy in the advancement of nut growers' interests, and gives special attention to spreading the gospel of pecan growing.

RIPENING THE DATE.

Chemistry and ripening of the date and other matters of interest to producers are given in Bulletin No. 66 of the Arizona Experiment Station. It is intensely interesting and has a vast fund of information on an industry little understood. Arizona is foremost in date production, and we believe there will be great increase in the planting during the next few years. The bulletin is a credit to the station.

TOO MUCH FOR HIS MONEY.

Mr. Winthrop Howland writes: "I wish to express my appreciation for the benefit derived from my advertisement in the Cultivator. So many have written me on the subject of milch goats that it will be some time before I can answer them all. Kindly explain to readers who have not received answers." Mr. Howland says further that he will be unable to sell any more animals until January kidding time.

CONSERVATION CONGRESS.

The new officers of the Conservation Congress are: President, J. B. White, Kansas City, Mo.; executive secretary, Thomas R. Shipp, Washington, D. C.; treasurer, D. Austin Latchaw, Kansas City; recording secretary, James C. Gipe, Clarks, La.

The newly elected president has been chairman of the executive committee of the Congress for two years and has long been active in conservation work.

MALTA FEVER.

The Department of Agriculture is now investigating the introduction of Malta fever by goats brought into Texas from the Island of Malta. It is declared that in Northern Texas and sections of New Mexico this is becoming very serious, both as affecting the goat industry and humans who have taken the disease from the goats. It has been in existence there for many years, but the gravity of the situation has not been appreciated until within the last few months.

SAVE THE FILES.

Every week come in inquiries that have been answered in some former number of the Cultivator, and instead of answering in the query department, which is already too long, word is sent by mail to the inquirer to refer to a previous number, and usually the answer comes back that the number is lost and requesting another. We suggest again that each number of the Cultivator contains some point which is worth enough to be given shelf room to preserve the entire year's issue. At the end of each six months an index is made of the articles appearing in that volume.

We do not suggest this to deter our friends from writing to the office for further information, for that is our business, the supplying of information, and we trust all queries will continue to come, but there will be abundance of problems to engage all our surplus time without unnecessary repetition of old answers. A file is a remarkably good tool for sharpening things, and the file of the Cultivator should be used for sharpening the wits of those who look to it for help.

MUNICIPAL FORESTS.

San Diego is the first city in this state to establish what is common in some European countries, a municipal forest to assist in bearing municipal expenses. A few years ago it was decided that the pueblo lands should be used for planting trees instead of disposing of them in small parcels as had been done prior to that time. There are still about 7,000 acres, all within a few miles of the city, and these are being planted chiefly to eucalyptus. How great the profit will be or how much taxes will be lessened remains to be seen, but we are glad one city is progressive enough to make the experiment.

SAN DIEGO SHOW.

The fall flower show of the San Diego Floral Association will be held October 25, 26, 27. The San Diego association is a live one and is making every effort to be worthy of a great exposition city. It has charge of the thousand dollar exposition rose contest, in which there have already been made nineteen entries. These are from seven different states. Thirteen of the contestants reside in California, and the other six in New Jersey, Texas, Kansas, Tennessee, Indiana and Maryland. We do not know whether San Diego County growers are barred or not, but so far it has not a single contestant.

OLMSTEAD RETIRES.

It is to be regretted that the Olmstead Brothers, landscape architects, have withdrawn from connection with the Panama-California Exposition at San Diego. In expressing regret as to this loss, the "California Garden" remarks: "A certain policy of compromise and makeshift has crept into all public work at San Diego." If San Diego is going to make a reputation for its 1915 exposition it wants to get busy and stop the contentions which seem to have had their start with the society event of choosing a queen to preside at the festival of ground breaking. Petty jealousy and advancement do not work together. How big is San Diego?

NEW YORK LAND SHOW.

California has been specially active in preparation for an exhibit at the great land shows to be held in New York and Chicago. The New York Show opens in Madison Square on November 3, and that at Chicago on the 18th, with nearly a week between, in which time many of the exhibits will be transferred. Luther Burbank joins in the preparation of the California exhibit and will be present during a portion of the time. Those who know of this exhibit declare that it will be one of the finest. It may help in attracting more tourists than are now coming, but it must be confessed that even at the present the railroads are placing a vast number of new people in this state.

DOLLAR FIFTEEN RATE.

Great disappointment obtains in the ranks of the lemon growers. The ruling of the Interstate Commerce Commission granting a reduction in the rate on lemons which was increased by the railroads immediately after the establishing of the cent and a half tariff has been reversed by the Commerce Court. This will mean an annual cost to the growers of between two and three hundred thousand dollars. It is expected that the commission will carry the matter to the Supreme Court. We note that dispatches from Washington indicate a movement to abolish this more than useless tribunal. It is assumed by some that it was established to nullify the good work of the Interstate Commerce Commission, and if such was the intention it is making good to its creators. It has been deemed that this is only another proof that the interests do use the courts to accomplish their ends over the will of the people. Yet there are many who do not believe in the recall of a judge, because of his claimed infallibility.

PROTECTION ON FRUITS.

The lemon men's ability to cooperate in marketing their fruits and in perfecting another organization to look out for transportation, tariff and other great questions has stood them in good stead. The fight is not yet finished and the same organization still has work before it. There has been a great deal of talk about the attack on the lemon tariff, but let us not allow our interest in the lemon to overshadow other fruits and nuts which may mean as much or possibly more to the state. Almost every fruit produced in California is being aided by protective tariff. The lemon men are looking out for themselves, but what about the raisin, prune and other dried fruit producers? Are they gathering together facts and figures and perfecting an organization which will be able to present these facts and figures before the proper committees when Congress convenes? Outside of any political consideration of free trade and protection, so long as protection obtains, and we believe it always will in America, the fruit grower may just as well be prepared to take advantage of it and protect his own industry as does the great manufacturer of the Atlantic seaboard. Let the fruit people get busy.

WATCH YOUR CREDITS.

Every Cultivator which goes to a regular subscriber has on it or on the wrapper a label showing date to which subscription has been paid, yet often complaints are received because some months previous payment has been made and no credit given. Will not subscribers note these labels, and if the dates are not changed within a couple of weeks after remittance, send word to the office, that the matter may be attended to while it is still fresh in the memory of all? At the top of the first column on this page is the statement: "Dates of expiration of subscripton accounts appear each week on the address label. 'John Jones 7-11' means that John Jones has paid his subscription to July 1, 1911. Notify us by mail if you desire to discontinue." This appears in each issue, but we assume it is a portion of the paper that is seldom read, so we trust we may be pardoned for repeating it here and calling attention to it once more.

The Cultivator is continued to subscribers until request is made to stop, unless the subscriber is a year or more in arrears, when, by the postal regulations, we are compelled to stop sending the paper.

Agricultural News Notes of the Pacific Coast

Northern California

The quail season opens next Sunday.

Orland, Glenn County, is planning for a poultry show this fall.

Pears are the leading fruit now going forward from Sacramento.

Cowboys are engaged in the annual roundup of beef cattle at Ft. Bidwell, Modoc County.

Sacramento Valley Tokay growers are shipping table grapes packed in fine redwood sawdust.

Sonoma County's tomato crop is reported as excellent. It is being handled by the California Fruit Canners.

One truck gardener at New Pine Creek, Modoc County, made a profit of $200 per acre from his crops this year.

Bogue, Sutter County, has shipped nearly 300 cars of peaches since July 1st. The fruit went mostly to canneries.

Yolo County people are urging the immediate beginning of work on State Highway across the Yolo Basin to Sacramento.

Land on the west side of Sutter Basin in Yolo County has been purchased and will be reclaimed and subdivided. The tract comprises about 25,000 acres.

It is claimed that San Francisco capitalists contemplate an irrigation scheme for Tehama and Glenn Counties which will involve the expenditure of ten million dollars.

After the recent storm it was reported that half of the table grape crop of the Sacramento Valley had been destroyed, but this is now found to have been an overestimate.

The prospects are more favorable than ever for an irrigation system for the Honey Lake Valley in Lassen County. The valley contains many thousands of acres of rich land.

Suits which have been in the courts several years regarding lands near Martinez, have been settled, and it is hoped the lands will now be thrown open to settlement by small holders.

Preliminary work for the construction of a dam of the Feather River near Greenville, Plumas County, has been taken up, which calls for the irrigation of nearly 40,000 acres of land.

Oroville orange growers expect this will be the banner year. Picking will begin not later than Nov. 5th. A canvass of the growers shows that the crop will be by long odds the largest ever.

A mass meeting was recently held at Santa Rosa at which the Sonoma County Co-operative Poultry Association discussed the egg market with the contractor who had agreed to handle the crop.

Prof. Clarke of the State University is holding a series of Farmers Institutes, the first being at Little Shasta, Siskiyou County last Monday; another at Diever, Lassen County, Oct. 4-5; another at Fall River Mills, Siskiyou County, Oct. 6-7.

Notice of appropriation of 100,000 miners inches of water of Little Stony Creek has been filed with the recorder of Glenn County. It is claimed the waters are to be used upon lands west of Willows and north into Tehama County.

Central California

Escalon, San Joaquin County, is asking for a creamery.

There are now 34,954 acres of irrigated land in the Modesto district.

Huron, Fresno County, will produce about 125,000 sacks of Egyptian corn.

A Kerman grape grower has 16,000 trays of raisins drying from seventeen acres.

It is now estimated that the shortage of the raisin crop will be about 40 per cent.

The San Jose Grange spent its last meeting discussing constitutional amendments.

Farmers of Porterville, Tulare County, have organized a co-operative telephone service.

Canneries of Central California are sending out several cars of canned goods every day.

The San Jose Dog and Poultry Show is being held this week with the greatest number of entries ever.

The Southern Pacific is working with the Supervisors of Kings County in eradicating squirrels from its lands.

A dairyman at Hughson, Stanislaus County, claims the successful operation of a milking machine at his dairy.

The rush at Selma cannery is over and while fruit is still being delivered, not in the quantity of a few weeks ago.

The Farmers Union of San Jose was recently addressed by a representative of the Marine Hospital Service on squirrel eradication.

San Joaquin County farmers are raising money by levying a five cent per acre tax for the purpose of fighting the ground squirrel pest.

The Tulare Dairyman's Association met recently at Tulare and discussed the matter of grading cream and securing better prices for dairy products.

The California Wine Association has reduced its prices on sweet wines 25 per cent, which is alleged to be the first step against the independent wine makers.

Railroads have made a special reduction in tariff on table grapes because of the demoralized condition of the market, and a $269 rate now obtains instead of the former rate of $299.

The Board of Supervisors of Madera County have refused to continue the fight against the squirrel pest because the Federal Government has declined to care for the pests which occupy the reserves.

Boosters for the Watsonville Apple Show, a trainload of them, descended on San Jose one day last week and extended an emphatic invitation to attend the apple fair which is being held this week.

Prominent fruit dryers are somewhat concerned for fear President Taft may join with Dr. Wiley in his famous sulphur ruling and that great injury may possibly be done to the fruit industry.

Delegates from six counties, Amador, Merced, Mariposa, San Joaquin, Tuolumne and Contra Costa, met in Stockton Saturday to discuss the matter of uniting in one exhibit at the Panama-Pacific.

Southern California

Redlands is planning for a carnival.

Imperial Valley has already shipped several cars of cotton.

The biggest and finest crop of walnuts ever is the general verdict.

San Bernardino Indians complain because of shortage in the pinon crop.

Imperial Valley will make exhibits at the coming Arizona Territorial Fair.

One of East Highlands orange packing houses is supplied with a precooling plant.

Yucaipe Valley apples are showing up an unusually large crop of excellent quality.

El Centro reports a greater acreage of September sown barley than was ever planted during that month.

The Loma Ranch Olive Company of Fallbrook has received a carload of machinery for the manufacture of olive oil.

It is now assured that the Rincon road along the coast in Ventura and Santa Barbara Counties will soon be constructed.

One barley grower of the Imperial Valley has just sold his crop of 11,000 sacks at $1.60. This is the record sale for the Valley.

A company has been formed at Santa Ana for the purpose of planting 2000 acres of sugar beets on the Santa Margarita Ranch.

Some cotton pickers in the Coachella Valley are reported to have gathered as much as 400 pounds in an average working day.

A careful inspection by Deputy Strong in the alfalfa fields of the Imperial Valley shows them to be free from the alfalfa leaf weevil pest.

Sugar beet growers of Southern California have secured the requested increase in price, fifty cents being added for the coming season's contract.

Lemon growers are making preparation for the fight which they know they must face when congress meets to preserve the tariff on lemons and the entire lemon industry.

Cattle men of San Bernardino County report the pasturage on the forest reserve as exceptionally good this year. The cattle have already been moved to lower regions.

The big walnut crop is causing some growers to call upon school children to aid in the harvest regardless of the provisions of the child labor law. One school at Goleta, Santa Barbara County, closed during the harvest.

The record for summer shipments of oranges has been broken this summer, when the three months ending Sept. 30 saw 6,540 cars as a total. The previous largest shipment was more than 1,200 cars short of this.

Southern California's orange crop is thought to be equal to last year's crop in quantity, and from present indications the quality will be superior. As to ripening, it will be some two or three weeks later than last year.

The California Fruit Growers Exchange handling most of the orange crop of California reports an output last year of 10,842,831 boxes, or expressed in cars, 28,123. This is an increase of over 8000 cars over the preceding year.

The Coast

The wool industry is the largest single industry in Nevada.

Whitman County Fair will be held at Colfax, Wash., Oct. 16-21.

The Philippine Islands are now making sugar from the sap of nipa trees.

The Willamette Valley in Oregon is receiving a large number of colonists.

San Diego Fair boosters will attend in special train the Territorial Fair at Phoenix.

The Fremont County Fair at Rexburg, Idaho, has just closed its most successful meeting.

The State Horticultural Inspector of Idaho refuses permission to sell wormy apples in that state.

Products of the Yakima Indian Reservation were exhibited at the fair at Toppenish, Washington.

The Agricultural College of Idaho will give special instruction in irrigation at the State Fair.

The three states, Washington, Oregon and Idaho, will produce this year 64,000,000 bushels of wheat.

The fruit crop of Idaho is declared by a state horticultural inspector to be larger than any preceding year.

The Sixth International Dry Farming Congress will convene in Colorado Springs, Colorado, next Monday.

A farmer at Ilo, Idaho, recently hauled one load of timothy seed to market for which he received $781.

The State Agricultural College at Bozeman, Mont., is experimenting with dynamite in digging holes for trees.

A hog raiser at Pullman, Wash., claims a return of seven hundred dollars for a ten dollar investment in hogs.

Hop growers at Yakima, Wash., have refused 50 cents per pound. Picking is now in full swing with 2500 pickers in the field.

Cherry growers at Careywood, Idaho, report "Black cherry aphis" which has caused fearful destruction to cherry trees.

The State of Washington has passed a law compelling all pupils attending public schools, whether city or country, to make agriculture at least a part of their course.

Cocoanut growers of the Philippine Islands fear that the soya bean will prove a serious competitor in that the oil from them is said to be the equal of the cocoanut oil.

Grain growers of Washington are endeavoring to conquer the smut pest. Some have soaked their seed in a solution as strong as one pound of vitriol to two gallons of water.

At the recent meeting of the Oregon Pure-bred Livestock Association at Salem, Dr. Withycombe made the statement that Oregon livestock brings the producers $91,689,000 per year.

A tract of land containing over a hundred thousand acres will soon be under irrigation because of waters carried under the Colorado in a great siphon constructed by the reclamation service.

The State Bee Keepers Association of Oregon meeting recently at Corvallis, resolved that the industry in that state demanded more protection and petitioned the appointment of a bee inspector.

ONION SETS ONION SEED

ALSO

Bulbs for Fall Planting

Our importation of Dutch Bulbs has arrived. This stock is the very best and our prices are low. Come and see the display or send for free Catalog at once. Also for our large Seed Catalog, if you haven't one.

Egg-More

The biggest egg producing food made. Not merely a strong tonic, which is not advisable to be fed regularly, but a FOOD, highly concentrated and very rich in protein. EGG-MORE mixed in proportion of one pound to 6 lbs. of good ground grain feed will keep the fowls in good health, maintain a strong and vigorous system, make the hen molt early, feather out quickly and convert the protein into eggs. It has been doing just that for six years, and each year the sales have greatly increased. It is the biggest selling poultry food on the market today. 4 lb. package, 35c; 12½ lb. sack, 90c; 25 lbs., $1.65; 50 lbs., $3.00; 100 lbs., $5.50. We pay freight within 200 miles on sack of 25 lbs. or over. Send for EGG-MORE BOOKLET.

Profit in the Poultry Yard

Practical poultry people who may have ideas from their experience as to methods of feeding and housing and general care of poultry will confer a favor upon the Cultivator and its circle of readers by sending in concise accounts. Mrs. Basley is always willing to answer queries, which with the experience of others should make this a most valuable feature in poultry life on the Coast. Opinions or matters of a personal nature should be omitted, but a concise statement of facts is always valuable.

WHAT IS THE BIGGEST POULTRY PROBLEM?

"The three problems in poultry raising that trouble the farmers of Oregon more than any others," says Professor James Dryden of the Oregon Agricultural College Poultry Department, "are first, getting the eggs in winter; second, lice and mites; and third, raising the chicks.

The answers to this question are designed to show why there is not more profit in the business. Out of 333 answers we received the following replies: 62 said the problem was, how to get eggs in winter; 60, lice and mites; 56, raising the chickens; 24, hawks; 6, coyotes; 34, other vermin; 4, rains or wet weather; 20, feeding; 9, hatching; 58, miscellaneous difficulties.

"To make the hen lay in winter is apparently the real problem, and yet its solution depends upon the solution of the other problems. It is not merely a question of caring for or making the hens lay. The problem goes back to the making of the hen. If the hen were made right there would be little trouble in making her lay. How to make the hen lay in winter resolves itself largely into a question of making the hen.

"I am inclined to think that the 56 who said that the raising of the chicks is the hardest problem came nearer hitting the nail on the head. To get a profitable egg yield under any conditions, the flock of layers must be frequently renewed. The old hen doesn't pay. For commercial purposes it seldom pays to keep her more than two years. This means that in a few years the farmer has raised several generations of fowls, and any mistake in the breeding or raising is soon evident. To be successful a poultry raiser must be able to maintain offspring with the same vigor and vitality as the parent; otherwise there would soon be no eggs in winter because of lack of constitutional vigor in the stock.

"But it is not all in the raising. There is probably more in the breeding, and it is not so much a matter of the breeds. No matter how they may be raised, fed and cared for, some hens won't lay, because they have not the breeding and laying capacity. On the other hand, some will lay, almost in spite of neglect; that is a question of breeding.

"One farmer replied to the question, that the problem with him was, 'To make the exit large enough for the hens, but too small for our valuable cattle dog, and to have open front house and yet be protected from skunks, owls, hawks, and wild cats.'

"Another complained of the problem of shipping and marketing; another has difficulty in getting on the market the kind of feed he wants, and still another finds his problem, "To keep the chicks growing from time of hatching until ready for market and keep them free from disease.'"

KEROSENE EMULSION FOR VERMIN.

During the past year we have had less trouble with vermin than ever before, and I give the credit to kerosene emulsion applied liberally and often. At least once each week we spray the nests, perches, dropping boards, the ceiling over the perches and the back wall above and below the dropping boards. We use a bucket spray pump and do the work thoroughly, giving every board and crack a good wetting, and if the nesting material is clean we do not take it out but soak it until the water drips from the nests. This is done late in the afternoon after the eggs have been gathered. The nests are dry by the time the hens want to use them the following morning, and are free from vermin of any kind.

The only severe case of mites we have had to contend with this season was in a colony coop used as a roosting place for broody hens. This coop was in a small yard and had been overlooked when the general warfare was carried on until it was in pretty bad shape. We cleaned it out, sprayed it once with whitewash and twice with emulsion and had no more trouble. Since then it has had its regular weekly spraying with the other quarters and is in excellent condition. If there are any mites around the poultry plant they will be found in the "broody coop" as the hen carries them with her from the nest. Colony coops containing growing stock are treated in the same way.

How Kerosene Emulsion Is Made.

As well as being effective as a vermin destroyer it is very inexpensive, costing little more than one cent per gallon. At this price one can afford to apply it in liberal doses. It is made as follows: Dissolve by boiling one-half cake of laundry soap in two quarts of water. Remove from the fire and while hot add one gallon of kerosene and stir rapidly until mixed to a creamy consistency. This is a stock solution, and can be put in a jug or bottle and kept indefinitely. It should be well corked to keep out flies, otherwise it will have to be strained before it will pass through a sprayer. To use take one part of this mixture to seven parts of water, mix well and apply as a spray.

At this time of the year hens having access to soft ground will make their own dust bath, and if the poultry house is kept free from lice and mites the fowls will not be troubled by them to any great extent. The main point is to keep everlastingly at it.

Kerosene emulsion is also used by fruit growers for plant lice, but owing to the danger of injury to the foliage it should be diluted to one part of emulsion to ten of water, instead of one and seven.—The Standard.

LIVER TROUBLE IN FOWLS.

Generally speaking, liver troubles follow acute indigestion. This indigestion may be brought about by irregular feeding, or being fed on one kind of grain too long, dirt an sour feed with poor supply of grit. To withhold the food a long time and then allow it in over amount is one of the most fruitful sources of digestive disorders.

Drinking water which has been contaminated with filth, or which has stood in a warm place, or in the sunshine until it has become putrid; exposure to draughts, cold rains, or damp roosting quarters, particularly during the moulting season, are all conducive to indigestion.

If any one of these conditions surr unds your fowls, change them, putting them in light, dry houses and giving them wholesome nutritious food. In very bad cases give daily 5 grains of rhubarb, and every fourth day one grain of calomel, says the Union Guide. Give them plenty of grit and charcoal. Charcoal is one of the best purifiers for the system of either fowl, animal or man.

The liver is one of the most important organs of the body, furnishing bile, one of the principle digestive fluids. It also assists in some of the most necessary chemical changes which occur in the blood. It is therefore an easy matter for it to become deranged from the causes that produce indigestion. Inflammation of the liver is quickly followed by death unless immediate relief can be given. The symptoms are a yellow appearance of the skin, and yellow or slightly bloody evacuations. One of the chief indications of this disorder is lameness, especially of the right leg, and when this shows itself you may be pretty sure that inflammation of the liver is going on. D. E. Salmon, D. V. M., says the treatment of birds so affected is not profitable unless they are very valuable for breeding or exhibiting,

Napa.—Jan. 4-6, 1912. Napa County Poultry Association. Wallace Rutherford, secretary.

purposes. His remedy is one-half to one grain of calomel to begin with, followed by 20 grains of Epsom salts and two grains of bicarbonate of soda after twelve hours. Naphthol, or benzo-naphthol, may be given twice a week to disinfect the intestinal canal. When the sick bird is considerably improved give green food, tonics or raw beef, and allow the bird free exercise in the open air. The disease is not contagious, but the cause that produced it in one bird may affect the whole flock.

ALFALFA FOR POULTRY YARDS.

Philo K. Blinn, Colorado Experiment Station.

Alfalfa is one of the best plants to furnish green food for chickens, but ordinarily it soon kills out if over pastured.

Alfalfa crowns that have been cut off and plowed under, and that have taken root again, are much harder to kill out, as many have found by repeatedly grubbing out the same stool that has taken root the second time. Such crowns seem to put out shoots from each piece of root that is left in the ground, if the soil is in favorable condition.

Those who desire to establish alfalfa in their poultry yards can succeed in this way by plowing or spading under alfalfa crowns that have been freshly plowed out from some field near by. Early in the spring is the best time, while the crowns are still dormant. The crowns should be covered four to six inches deep, and the soil wet down and kept moist, and the chickens kept off until the crowns have become established, which will be much sooner than alfalfa from seed, and will stand much harder pasture.

There is four per cent less of protein and six per cent less of fat in eggs than in sirloin steak; half as much protein and one-third as much fat as in cream cheese; twice as much protein and ten times as much fat as oysters. Fuel value, about one-third that of rich cheese, and two-thirds that of beef. It is the protein or nitrogenous matter that builds up and repairs the tissues of the body, while the fat supplies energy.

Medical science says that raw eggs are more quickly digested than cooked ones. Soft boiled, roasted and poached eggs are more easily digested than when fried or hard boiled. The stomach will digest a raw egg in from one and a half to three hours. Soft boiled and roasted require from two and a half to three hours, while hard boiled or fried must be allowed from three and a half to four hours for digestion. —Poultry, Garden and Home Advocate.

The great number of entries at the Kings County Fair forced the building of new sheds and barns.

Irrigation and Forestry

FLORIDA METHODS OF IRRIGATION.

No matter how rich our country may be in an agricultural way, or how deep and black the soil, it would soon cease to produce if moisture were withheld, as all plant growth absorbs food in liquid form. In the first place the very microbes whose function it is to prepare the meals underground, cease action and become dormant when the soil becomes dry, but are awakened to active life at once upon coming into contact with moisture.

Unfortunately there is no known land on this wide earth where it rains just enough either to suit plant development or to please everybody, hence if we wish to be uniformly successful, we must supply as well as remove water artificially. In locations where the moisture supply is under absolute control, the most intensive and successful farm operations are carried on, and the greatest amount of products grown per acre.

Successful planters, being ambitious, are continually striving to do better, hence better methods are adopted as quickly as they are proven a success, and for this reason many are preparing to irrigate in all parts of South Florida, especially since our crops here are grown principally in or during the dry season of the year.

There is considerable inquiry in regard to the irrigation subject, and various kinds of plants are being installed. The styles of plants are governed by the kind of soil and sub-soil, whether sand, muck, clay or marl, the latter three possessing the faculty of retaining moisture to a much greater degree than the first named. The water supply also governs the kind of plant installed to a large degree. On land with sand or rock subsoil, irrigation is accomplished by what is known as the overhead system. It is a very successful method, as it not only is economical of water, but it would be impossible to hold water in sandy subsoil on account of its leachy character. This style is the most costly to install. Besides the expense of mains, consisting of two to four-inch pipe, laterals must be laid 25 to 40 feet apart, with long or short standpipes (usually about six feet high) of three-quarter-inch iron pipe placed in a corresponding distance apart.

These standpipes are crowned with various kinds of spray nozzles, aiming chiefly to get such a nozzle as will distribute over as large an area as possible. This system has its advantages as well as its disadvantages. Among the former may be counted the prevention of damaging frost; it also washes off red spider and makes it unpleasant for leaf-eating insects; on the other hand, it has a tendency to produce a class of fungi such as flourish best where the foliage is damp.

This overhead system requires a pressure of about 25 pounds per square inch to properly force the water and to generate such a spray as will best imitate a fine rain. Spraying is best applied evenings or after night, but beneficial applications can be made during cloudy weather. In all attempts at irrigation, you will make no mistake by using a surplus of water and by keeping the soil—especially if of a sandy loam—constantly in a moist condition; and unless this is done religiously, absolute failure is liable to result.

Probably the method that is most successful is the one of placing underground tiles and forcing water through them. This is the system so largely used at Sanford, Florida. However, this system is only feasible where there is a sub-stratum of soil which is more or less impervious to water, such as clay, marl or hard-pan subsoil.

When the Everglade drainage is completed, it is proposed to install locks in the canals and thereby control the water level in the soil. This will at all times provide moisture and will eventually assure very cheap irrigation for this entire area. But until this work is completed, which will take some time to accomplish, smaller areas in this section can be controlled easily by putting in one of the shallow lift pumps of great capacity, such as are used to pump out, or flood rice fields.

With all crops, especially vegetables, the increase in production is very marked when water is applied scientifically, the increase being often double; in fact, in seasons of protracted drouths little or nothing can be grown unless under water control. Not only is this increase in production to be noted, but the quality is proportionately improved, and such products always bring an increased price in the market, and are in much greater demand. A great number of our tropical plants require considerable moisture and will not produce properly unless an adequate water supply is at hand. —Florida Star.

GROWING LOCUST TREES FROM SEED.

By B. O. Longyear, Colorado Agricultural College.

Any person who can secure seed of black or honey locust can readily grow his own trees of these two species. Seeds that have been kept dry, even eight or ten years, will grow almost as readily as those that have been gathered but one year. In either case the seeds are so hard that if planted dry, as one would peas or beans, many of them will fail to germinate, and all of them will be very slow. They should first be treated with hot water, in the following manner:

For about one-half pound of seed, place the seeds in any can or jar that will hold about one gallon and that will not be broken by hot water. Pour about two or three quarts of boiling water upon the seeds, cover, and allow to stand over night. When the water is poured off, it will be found that many of the seeds have doubled in size and become softened. These should be taken out and may be planted immediately, while those that remain hard should be treated in the same manner until all of them have swollen.

Plant in good garden soil, in rows about three feet apart, planting the seed about one inch apart in the case of the black locust, and three inches apart for the honey locust. Cover the former two-thirds of an inch, and the latter one inch deep, and firm the soil upon them. As soon as the plants break through the ground they should be given the same cultivation and irrigation as a crop of corn. The young trees will probably need thinning so as to make them about four to five inches apart in the row. This will give much stronger seedlings than to allow them to grow much thicker.

At the end of the growing season it is best to dig the young trees and plant them in permanent quarters.

TRANSMIGRATION.

One morning Jenkins looked over his garden wall and said to his neighbor:

"Hey, what are you planting in that hole?"

"Oh," he said, "I'm just replanting some of my seeds, that's all.'

"Seeds!" shouted Jenkins, angrily. "It looks more like one of my hens."

"It is. The seeds are inside."

NATURAL GLADNESS.

Of all the good gifts which ever came out of the wallet of the Fairy Godmother, the gift of natural gladness is the greatest and best. It is to the soul what health is to the body, what sanity is to the mind, the test of normality.—Bliss Carman.

Watsonville's Apple Show prizes will aggregate about $2500.

Questions and Answers

THE EDITOR AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Bee Moth.

Is the larva or cocoon enclosed foul brood? I have found them in four new hives. I bought six last spring that had never been used before. The bees are all last spring's swarms. The hives which show these cocoons have no honey and but very few bees of young brood. The other two hives have a fair amount of honey and have brood. In front of the affected hives is powdered dust like substance thrown out of the hive entrance.—Subscriber, Sonoma.

There was nothing alive in the letter when it reached the office, but three shells or empty cocoons of the bee moth (Gallearia mellonella) and in no way similar to the foul brood. Plainly from the description of subscriber his four hives are very weak and should be combined to two or possibly one brood. A good strong swarm of bees will not tolerate the entrance of the bee moth. It is possible also that there may be no queen in some of these hives. It would also probably be advisable to partly close the entrance, so it might be the easier protected. The hives should also be looked over to see that there are no crevices which will permit entrance of the moth. Do the sides fit closely to the bottom, and is there a perfect fit of the top? Of course, it goes without saying that you should go thoroughly through all the hives and destroy the worms in every one of these cocoons or any which may be seen crawling about the hives. Another valuable point is to see that your bees are the Italian, for hives of the Italians are seldom infested. This may be accomplished by getting good Italian queens.

Teat Injured.

My cow lacerated one teat on a barb of a wire fence. I sutured the wound and used a tube, but now the milk flows through the part injured. Is it possible to dry that teat without drying the others?—Subscriber, Laton.

It is not advisable to try to check lactation in a single quarter of the udder. Allow the cow to dry off in the ordinary way, then carefully cut away the edges of the false opening and bring the lips of the bleeding wound together with silk sutures. Before operating clean your hands, the teat and the instruments with carbolized water, and after operating remove all blood clots, dry with absorbent cotton, and keep the part protected by coating daily with zinc oxide ointment till healing is complete.

Veterinarian Wanted.

A good veterinarian is needed in our vicinity. Our town has a population of several hundred and is located in a stock raising country. We are twenty-five miles from the nearest town having a veterinarian and forty miles from the next nearest. I think a good veterinarian could do well here. —Subscriber, Ballard.

Considering the small size of your town I doubt if it will be possible to secure a qualified veterinarian unless you offer some special inducements, say in the form of a guarantee that a specified amount of work may be done within one year, depositing a sum to cover a possible deficiency, or find a student who desires to combine veterinary practice and farming. I would suggest that you address your application to the Colorado A. & M. College, Fort Collins, Col.; Ohio State University, Columbus, Ohio; Iowa State College, Ames, Iowa, or other agricultural and mining colleges having veterinary departments. The San Francisco Veterinary College, San Francisco, Cal., might be able to send you a veterinarian.

Cutting Eucalyptus.

Replying to the subscriber who asked as to cutting eucalyptus so that the stump will sprout again, will say that the best time to cut the eucalyptus is when the axe is sharp. I find that they sprout as readily when they are cut in August as in January.—A. E. R., Laton.

Dip for Hens.

We have had several references to the article on dipping poultry which appeared in the issue of Sept. 21st. It was a general argument in favor of a liquid dip for lice and mite troubles, but gave no definite formula. The kerosene emulsion which doubtless all know how to mix, is excellent. A one per cent solution of carbolic acid in water is good. If care is used not to get the solution in the eyes and thoroughly mix it, it is possible that this might be as strong as a 5 per cent solution. A solution made by steeping tobacco stems in water is also an excellent dip.

Hints.

I get so many good ideas through your query columns that I believe it is a good thing for each reader to mention those things which he finds effective or economical in his farm work. I also think we should when we see some recommendation worthless, give it publicity and save others time and expense. This was the case with the fly repellent which Mrs. Reimers of Dinuba gave us information about.

Bloody milk is something which has affected several of my cows. I have always had success by throwing a handful of dry sulphur over the hay in manger or other feed. It has never taken over five or six doses to cure.

For stick-tight fleas I tried the brine treatment on three cockerels. The brine was so strong that it would bob up an egg like a cork. I kept their heads under the brine several minutes and rubbed wattles and ears thoroughly. After twelve hours found the pests just as full of business as ever. The best remedy I have ever tried was to catch them by the tail and drop them down the lamp chimney when the lamp is lighted. These pests are surely a tribulation and hard to cope with. I find it possible to keep them down to some extent by moving hen houses, sprinkling the ground where they were with distillate and setting fire to it. Then spray the house thoroughly with distillate and later return to original place.—Subscriber, Oleander.

Ants in Orchard.

Small red or brown ants are doing much damage to my orange trees. They attack the tree just under the surface of the ground, working on the bark, and in time girdling and killing the tree. Please give remedy.—Subscriber, Holtville.

We believe the subscriber is wrong in giving to the ants credit for destroying his trees. As a rule they are not feeders on healthy vegetable tissue, but if the trees are in heavy soil or where gum disease has caused exuding of gum, the ants will be attracted. If the soil is dug up thoroughly about the trees, and possibly sand filled in close to the trunk, and other treatment as given on page 451 of Cultivator of April 13, 1911, the condition will be corrected, the trees will be made more healthy, and the ants will disappear. If they are the cause of the trouble, spray the ground with a solution of cyanide of potassium and pour a small quantity down their holes. This will soon eradicate them.

Sugar Beets for Stock.

Are sugar beets profitable stock food? How should they be fed?—Subscriber, Imperial.

Sugar beets are excellent stock food, but rather expensive, as their tonnage per acre is less than that of mangels or other large growing beets, and their food value is but little greater. The best way to secure feed

(Continued on Page 353.)

Established 1892. 112-118 South Los Angeles Street, Los Angeles.

FARM LANDS FOR SALE.

BUY

GOVERNMENT

LAND SCRIP

and avoid all doubt and interference in desert land entries and all matters of final proof.

No irrigation
No cultivation
No residence

By the use of
SCRIP.

The Government now has taken the ground that until there is an authoritative opinion by the Supreme Court of California as to the status of those holding water stock, all matters of final proof in pending cases will be suspended.

The General Land Office holds that, in view of the conflicting opinions of the California courts on the point at issue, the Stratton entry and all others similarly situated shall be suspended until a decision is given by the State Supreme Court governing the disputed points. The final proof in the Stratton land was made Nov. 22, 1907.

GOVERNMENT LAND SCRIP

is by all means the cheapest and most satisfactory method of securing public land.

Don't fail to call or write for our Booklet No. 14, which explains all about it.

FEN. S. HILDRETH SCRIP CO.,
315 Trust and Savings Bldg.,
Los Angeles, California.

210 Phoenix National Bank Bldg.,
Phoenix, Arizona.

FOR SALE— —$35 PER ACRE
351 ACRES A 1 CITRUS, GRAIN OR STOCK RANCH.

This tract consists of smooth rolling hills small valleys and beautiful slopes, and from the distance presenting a commanding view. The surrounding landscapes are very scenic and present a beautiful panorama. The soil is of a deep brown loam and does not crust or crack, and yet has no excess of sand.

225 acres grew a fine crop of wheat and oats this season; 75 to 100 acres more now growing sage and wild buckwheat can be easily cleared and farmed. Two small orchards in bearing show a fine growth and good yield of fruit without irrigation; good five room house, good size barn, windmill and tank, water piped to house and barn. All under fence. Is 7½ miles south of Escondido.

We have previously advertised this tract in these columns at a ridiculously low price of $20 per acre. But owing to recent developments in electric roads and irrigation systems we have concluded to offer this tract for a short time only at $35 per acre. This land is actually worth for grain farming $60 per acre. Conrad Realty Company, Escondido, Cal.

DAIRY RANCH
FOR SALE.

430-acre river ranch of deep heavy loam, with good improvements, including fully equipped dairy; 110 acres of fine alfalfa, producing from four to five heavy crops; 60 acres of fertile upland, suitable for fruits, berries and alfalfa; 130 acres fine timber and feed land; 130 acres cleared bottom land, raising large crops of grain, all suitable for alfalfa or fruits.

This property is all well fenced and lies within 1½ miles of railroad station with ten passenger trains arriving daily. For price and terms apply to G. E. Brinkerhoff, owner, Modesto, Cal.

For Sale—43½ acres 15 miles from Los Angeles, on Covina electric line, located on boulevard, and 1¼ miles south Baldwin Park. Sandy loam, deep soil and level. Twenty acres in alfalfa, balance grain. Six room house, domestic well and windmill. Forty shares of fine water stock and cheap. This is desirable locality, values steadily advancing, great potato country, but walnuts, oranges and alfalfa do fine also. Price $450 acre, half cash, divide in smaller pieces. Joseph Coleman, 412 First National Bank Building, Long Beach, Cal.

Lindsay District Orange Lands cost less money; produce more than any similar lands in the state. No scale, smut or diseases common to other sections. Crop marketed before the holidays, avoiding all dangers from frost. Ten acre tracts close to Lindsay, $150 per acre. Choice alfalfa lands, abundance of water, $50 and up. For information, call or write, Kious-Whann Realty Co., 235 Mason Bldg., Los Angeles, Cal.

For Sale—A 20-acre farm for $20 cash and $20 a month; possession now; $90 to $125 per acre; your crops pay for the land; rich, level land for alfalfa, oranges, almonds, grapes, cows, chickens; abundance of ditch water for irrigation for $1 an acre a year. Where else can you get this? In Oakdale Colony, near good town and railroad station. Climate delightful. T. Wiesendanger, 408 West Sixth Street. **Los Angeles, Cal.**

Write me for particulars on one of the best orange, lemon and walnut grove propositions you ever saw. 237 acres. 60 acres planted, full bearing. Where water costs absolutely nothing, from the mountains in Temescal, near Corona, Cal. The water right is worth one-half the cost of the ranch. No frost or scale. $10,000 crop on trees. One six-room house. Two four-room houses, barns, etc. All stock and implements. Price $60,000, one-third cash, balance terms, 6 per cent. Jos. Coleman, Room 412, First National Bank, Long Beach, Cal.

For Sale—San Luis Obispo County, 95.31 acres, lot 16, subdivision of Huasna Valley, 12 miles east of Arroyo Grande; well improved, home ranch; 60 acres bottom, inexhaustible water near surface, balance rolling, scattering oaks; school, P. O., coast climate, hog raising, poultry, dairying, principally; $75 per acre, $2,500 time. For particulars address owner, Chas. F. Wright, Huasna, Cal.

10 Acres Rich Soil on Grand Avenue, 1½ miles from Escondido; good lemon or orange land. Price $1,250. Conrad & Company, **Escondido, Cal.**

IRRIGATED LAND

FOR

$27 AN ACRE

?

In the Great Yaqui Valley, where your neighbors are the most successful farmers of California, Washington, Idaho, Oregon and Canada.

The rush to Mexico is on. The American farmer is beginning to realize that the only CHEAP land—that is, GOOD LAND—left on the American continent today is in MEXICO. IT'S THE LAST CHANCE. And the American farmer is taking advantage of it.

We have less than 5,000 ACRES of this land at this price, and it is going fast. Get it NOW while you can.

Land level as a floor—splendid irrigation system now in operation—railroad transportation — 15,000 acres now under cultivation, and American farmers behind the plows—wheat, barley, oats, corn, cotton, alfalfa, hogs.

Buy NOW—later on you'll pay more.

CHAS. F. O'BRIEN,

General Land Sales Agent,

112 West Sixth St.,

Los Angeles.

For Sale—
THE ORANGE GROVE MAN.
Large list of orange groves in best districts. Seven years' experience in growing oranges.

A. W. RICHARDS,
THE ORANGE GROVE MAN,
Claremont and Pomona, Cal.

The Best Bargain Yet—A good, well improved, money making farm of 56 acres, 2½ miles from Arroya Grande, Cal. A prosperous little town—no saloons. Five miles from Pizmo Beach, the finest beach in California. Free rural delivery. The house alone cost $2,000. Good barn and outbuildings. Fine roses. Walnuts and oak trees around house. Assorted berries and fruits. Plenty wood for fuel. Plenty of fine soft water. No irrigation required, consequently no danger of Bermuda grass or other foul weeds. Owner must have the money at once, hence the sacrifice. Price $6,500; $3,000 cash, balance two years, 8 per cent. Also an 80-acre tract of fine, level, loamy land, 50 acres of which is No. 1, in northeastern part of Santa Barbara County. Will grow alfalfa, vegetables, fruits, cotton, etc. No alkali or hardpan. Free timber 1½ miles away. Elevation 2,500 feet. No extremes of heat, cold or storms. Can be irrigated if necessary. $600 takes it. Same owner as above. Wm. T. Mantz, Maricopa, Cal.

For Sale—Five acres, two miles south of Monrovia, half set to deciduous fruit; plenty of mountain water and six-room house and barn. Forty acres at Corcoran, five-room house. B. F. Houser, Monrovia, Cal.

For Sale—Near Lancaster, Cal. Bargains in improved and unimproved land. Also relinquishments for sale or trade. Some homestead land. A. S. Burnham, Box 451, Lancaster, Cal.

Apple Orchards—Large and small, in the only apple producing section in California. The greatest section west of Missouri River. Write for booklet. Geo. W. Sill & Co., Watsonville, Cal.

San Diego County! My splendid weekly newspaper will tell you about this great county and superior climate. 16 weeks for 15c. H. P. Rising, publisher, Escondido, Cal.

560 Acres. $25 Per Acre.
Stock ranch; good rich soil; good buildings; plenty water; fine orchard; in line of new electric road. Address Conrad & Company, Escondido, Cal.

For Sale or Exchange for Los Angeles or Orange County acreage. Five acres in city of Santa Cruz, all in fruit, well improved. William Richard, 438 River St., Santa Cruz, Cal.

SUGAR BEETS FOR STOCK.

(Continued from Page 351.)

from sugar beets is to take them to the sugar factory, then buy back the pulp after the sugar is extracted. This, of course, is impossible in your section, so we would suggest growing the larger beets, which are of great value because of their succulence and corrective properties. Henry's "Feeds and Feeding" gives sugar beet tonnage as 23.8 with 85 per cent water, while the "half sugar mangel" has 26.6 tons with 88.9 per cent water. "It has less dry matter per acre than the sugar beet. Only one-half the labor is required to harvest the mangel, and, furthermore, the root keeps better than the sugar beet. The mangel is valuable for all kinds of farm stock, excepting possibly the horse." However, for cost and return per acre, all root crops are not to be compared to soiling crops.

"Why do you not hold up your head, as I do?" inquired an aristocratic lawyer of a farmer.

"Friend," said the farmer, "look at that field of grain yonder—all the valuable heads hang down, while those that have nothing in them stand upright."

Veterinary

Answers in this column by Fred G. Matthews, M. S., D. V. M., 1232 Central Ave., Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Forearm Cut.

My horse was cut to the bone on the forearm by barbed wire, but healed without being sutured. Later matter collected above and below the scar, opened and discharged until treated with rowels. The wounds have healed, but the limb is twice as large as normal and feels hard. Lameness is very pronounced. Kindly advise me whether to allow him to run in pasture or tie him up in the barn, and also give treatment to remove the hardness and reduce the limb.—Subscriber, Ceres.

It is very doubtful if it will be possible to accomplish the end you desire, unless I be mistaken in estimating the time elapsed since the injury occurred at four months or longer. The muscles involved were completely severed and their function permanently impaired, hence I presume the limb is carried in a dragging manner, and also the scar extends so deeply into the region that the return flow of lymp is more or less obstructed, consequently the accumulation of fluids has resulted in the enlargement of the limb below the wound. Have your druggist mix two drachms of red mercuric iodide and two ounces of cerate of cantharides, adding turpentine to make a thin paste. Clip the hairs from the limb and apply a little of the paste to the forearm from the scar to the knee and rub briskly to insure an even distribution of the medicine. Then tie the horse so he cannot reach the part with his mouth. After twelve hours wash with warm water and soap. Repeat every two weeks if results justify it. The horse will do better in the pasture.—F. G. M.

Fistula.

A fine four year old mare, not broken to work, has an enlargement on each side of the withers above the shoulders. They appeared six months ago. Is this a fistula or has she run under a tree and bruised the withers? —G. D. L., Stony Ford.

Fistula often starts in this manner, but it is possible that the withers were bruised by the animal passing under a tree or rolling against some rough object. Make a large opening in each of the enlargements, insert the finger to trace the pus to its source, and inject a two per cent solution of permanganate of potash into the tracts or cavities. When clear of pus pack the wounds with strips of cloth saturated with a mixture of equal parts of sweet oil and turpentine. Repeat this treatment daily.—F. G. M.

Eye Trouble.

The past two weeks a young colt about two months old has had a white scum over the ball of one eye. What can be done for it?—Subscriber, Tulare.

If there is a free discharge from the eye, examine carefully for injuries or foreign particles such as hairs, chaff, etc. Have your drugguist mix iodoform half scruple, calomel one scruple, boric acid one drachm and powdered sugar one ounce, and place a pinch of the mixture in the eye twice daily.

Cough.

A dog, two years old, took to coughing as if trying to dislodge something from his throat, but we could find nothing then. The dog finally died. We sometimes sponged him with kerosene for fleas. Could that have caused the trouble?—R. B., San Marcos.

No. A cough not accompanied by vomiting is usually to be attributed to disease of the air passages or the lungs.—F. G. M.

A little girl hearing her parents discussing how to keep milk from souring said: "Well, I'll bet it wouldn't sour if you left it in the cow."—Hoard's.

Anthrax Cure, Milk Fever Outfits. See O. J. Weber Co., 225-227-229-231 East Sixth Street, Los Angeles.

ROEDING TRUE REFS FRESNO, CAL.

We call particular attention again this season to the necessity of ordering early to get your needs fulfilled.

TREES

Prospective Tree Planters

Here are three reasons why you should correspond with us before you order any stock for this year's planting.

FIRST—Quality is one of the essential points. All our stock is grown under the personal supervision of men thoroughly trained and versed in nursery work. We insure every piece of stock we sell being "true to name."

SECOND—The only place to trust your order for nursery stock is with an established and conscientious firm. It takes several years to find out what the "fruits of your labor" are to be, hence the great importance of dealing with a reliable concern.

THIRD—The completeness of our stock. We grow everything that grows—Fruits, Berries, Grapevines, Ornamentals in deciduous and evergreen trees, Shrubs and Plants; Palms and Roses.

"California Horticulture The Fruit Growers Guide"

The Temper's the Thing

WHEN you buy a pocket knife—a razor or a safety razor—any cutlery, in fact, how can you tell whether it is going to give satisfactory service? You can always examine their external points, such as handles, linings, rivets, springs and finish, but the *temper* is the important thing, and in ordinary cases you can tell nothing about the temper until actual use shows it to be good or bad. Keen Kutter Tools and Cutlery have been the standard of America for over 45 years as a complete line—every article of the highest quality.

Every tool bearing the name Keen Kutter is guaranteed, not only to be perfect in steel, temper and adjustment, but this guarantee allows you to be the judge. If, for any reason, any Keen Kutter tool does not measure up to your reasonable requirements, your money will be refunded.

THE BOOK OF MEMORY.

My grandma has a curious book she
often lets me see
When in the dusk I leave my play to
sit upon her knee.
I cannot touch the book at all, but
shut my eyes up tight,
While grandma tells the pictures, and
I see them clear and bright.

I see the dear old farmhouse where
grandma used to play,
The barn, with all the cattle, and the
fragrant mows of hay,
The pets that grandma used to have,
and all her queer old toys,
And the little country schoolhouse
full of merry girls and boys.
And there are other pictures, too,
which make my grandma sigh;
She says I must not see them now, but
wait till by and by;
But, though she thinks they're far too
sad to show to little me,
She's sure they all look brighter when
I'm sitting on her knee.

My grandma says I'm making a book
to be my own,
And that I'll often look at it and smile
when I am grown;
And then I'm sure the picture that I
like the best to see
Will be myself, in the dusk on grandma's knee!

H. G. Fernald, in Young Days.

"PHILIP, MY KING."

"Philip, Philip my King."

The girl's bright face grew tender as the last notes of the old song died away and her white fingers touched the keys softly. When the music had ceased, the man beside her stooped and kissed her red lips lovingly, almost solemnly. The love of this pure girl seemed such a holy thing that its possession sometimes almost frightened him.

She gave him a merry glance as she said, "You must not bother me any longer. I have a great deal to do that will never be finished if I sit here all day singing flattering songs to you."

"May I not sit at your majesty's feet and watch you if I am very good?"

She shook her head. "No," she replied. "You are a great hindrance to sober industry. You are of too frivolous a nature to respect serious undertakings."

He bowed low in mock humility. "Well, I will go where I am better appreciated," replied her lover, rising to his feet and walking leisurely away.

Margaret watched him out of sight with a smile on her lips, and with no premonition that she would never again see that erect carriage and buoyant step she loved so well.

The afternoon was waning and the shadows were growing longer when Margaret saw George Allen coming hurriedly down the street. As he came nearer she saw that he looked pale and troubled. Flinging down her work she ran out to meet him. "Oh, George!" she cried. "You bring bad news! What is it?"

He took both her hands in his and said, "Margaret, dear friend, be brave. Philip has had a serious accident. He saved a workman's life at the risk of his own."

Margaret's lips whitened. "Is he dead?" she whispered. "Oh, no, no, he is alive but badly hurt." She clung to him for a minute. How he longed to take her in his arms and comfort her. He could not remember when he had not loved her, and in every plan of his life she had a part. But she belonged to Philip and his part was to serve them both.

With the first snowfall Philip was around again but so changed. His right arm and leg were gone and his face showed the traces of pain and ill health. Most of his savings were swallowed up by his illness and he could never hope to be well again.

"Never mind dear," said Margaret bravely. "I will work for us all." He had offered Margaret her liberty, and even besought her to give him up but she refused. She simply kissed him, saying "A crust with you, dear, is better than riches with any other man."

As time went by Philip grew stronger but seemed greatly changed. He would sit for hours silently brooding over his misfortunes. All his happy, sunny nature seemed changed. Stranger still, he grew indifferent to Margaret and was sometimes almost rude to her.

The maternal instinct, dormant in most women, was aroused in Margaret by his misfortunes, and she loved him as she never had before. "I must be very patient," she thought, "and remember what he is passing through. I could not bear it as well as he does."

One afternoon as she sat by the window sewing, a boy who was passing threw a letter into her lap. The note was short and read as follows:

"Dear Margaret:

Do not blame me too much for these written words which cause me as much sorrow in the writing as they will you in the reading. Dear friend, you and I must live our lives apart. I find that I do not love you as a man loves the woman he marries. I have been a long time coming to this knowledge and think it only right to tell you. I shall always be your grateful friend. Forgive and forget.

Philip."

Margaret was a proud woman of New England stock. She neither fainted or cried out, but read the letter through twice, then tore it into bits and threw it into the fire. She walked to her room with steady feet. But when the door was locked she fell on her knees beside her bed. She raised her clasped hands toward heaven crying passionately, "Dear God, dear God! where have I failed?" Her self-effacing love did not for a moment blame him. Some way she had failed him, some way she had been found wanting.

She was alone for the day and alone she fought the bitterest battle of her life. Only He who listened to her bitter cry, knew what she endured. At last, strong in His strength, she arose calm and serene. In her face was a new beauty, a new trust and peace. She sat down at her desk and wrote:

"Dear Philip:

I do not blame you, for love cannot be compelled. You did right to treat me frankly. If I can ever help you I will. God bless and keep you.

Margaret."

After two years had gone by George renewed his attentions and was accepted.

As time went on Margaret grew happy, for her husband was kind and devoted, and her nature was too sweet and wholesome to withold love from one who gave her all. Little children came, two sturdy boys and a winsome girl.

In the meantime Philip's mother died, and an old aunt came to live with him. He eked out a scanty income by teaching such pupils as would come to him. Margaret's children were among his pupils and loved him as did all children. He had changed since his accident. Instead of the happy, joyous man he had been, he became quiet and sad, but gentle and tender to a great degree. There were lines of sorrow in his face, and his eyes had a tired look in them that showed sadness hidden from the world and borne alone.

He became a power in the little village, a settler of disputes, a peace

Deaf People Hear Whispers

With Common-Sense Ear Drums —"Wireless Phones for the Ears"

For twenty years the Common-Sense Ear Drums have been giving good hearing to hundreds of thousands of deaf people, and they will do the same for all who try them.

Every condition of deafness or defective hearing is being helped and cured, such as Catarrhal Deafness, Relaxed or Sunken Drums, Thickened Drums, Roaring and Hissing Sounds, Perforated or Partially Destroyed Drums, Drums Wholly Destroyed, Discharge from Ears—no matter what the cause or how long standing the case may be, there is hope of good hearing for all the afflicted deaf.

The Common-Sense Ear Drum is made of a soft, sensitized material, comfortable and safe to wear. They are out of sight when worn, and easily adjusted by the wearer.

Good hearing brings cheerfulness, comfort and sunshine into the life of the lonely deaf.

Our Free Book, which tells all, will be sent on application. Write for it today to

maker, a father confessor to all who suffered or sinned. And so his beautiful, blameless life went on as the years went quietly by, till one day word came to Margaret that he was ill. At twilight a neighbor brought word to Margaret as she and George sat at their fireside reading. "Philip is dying," the man said, "and he wants to see you, Margaret." She went across the moonlit fields.

Philip's eyes were closed, but as Margaret bent over him he opened them and smiled. After a moment's silence during which she bent with her cool hand on his forehead, he spoke. "Margaret, have you been happy with George?"

"Yes, Philip."

"Thank God!" said the sick man fervently. "Sit down by me, Margaret, I want to tell you something before I die. I wish I were brave enough to carry this secret to the grave with me, but I have borne the burden so long, so long, that I must clear away all misunderstanding before God calls me away."

"Dearest, I could not see you grow old and worn before your time, I could not be a burden where I longed to shield, I dared not condemn you to a life of poverty and toil; yet I knew how true you were and that you would never give me up while you believed I loved you. So as the physician gives the bitter draught to save I wrote that cruel letter to save you.

"Oh, my God! the agony of seeing your wistful look when I pretended coldness! and that letter! My heart bled as I wrote it. Selfish man that I was, I half hoped that you would discern the truth. Yet I, too, have been happy, happy in God, in your happiness, and in trying to help others. Life has been lonely but not barren."

He ceased speaking. Margaret sunk on her knees beside him and laid his head on her bosom. "My Philip," she whispered, "noblest and best! I never blamed you! but Oh how little you know of a woman's nature. Every sorrow borne for you would have been a joy, every care a precious possession. You robbed me of a woman's birthright, to suffer and sacrifice for her own. Philip my king."

She put her arms around him and he held her in a close embrace. He spoke but once more, just saying, in a tone of ineffable weakness, "Good night, Margaret."

Back across the moonlit field she walked, but not alone, for Love and Youth walked with her. There was a new dignity in her step and a solemn joy in her face. She had come into her birthright.

She paused in the moonlight. There lay her home, there was the lamplight streaming from the window. In there were the husband and the children who loved her and whom she loved. She looked up at the moonlit sky, up there were God and Philip. She smiled through her tears as she murmured, "Philip, my king!" then turning swiftly she went into the house and shut the door.—American Cultivator.

ALL THROUGH A HYPHEN.

A certain member of congress was to make a speech near Chicago, but was unable to do so because the heavy rains had destroyed a portion of the branch railway. Accordingly, he sent this telegram: "Cannot come. Wash-out on line." In a few hours the reply came: "Never mind. Come anyway. Borrow a shirt." — Every Woman's Magazine.

There is no duty we so much underrate as that of being happy. By being happy, we sow anonymous benefits upon the world which remain unknown even to ourselves, or when they are disclosed, surprise nobody so much as the benefactor. A happy man or woman is a better thing to find than a five-pound note. He or she is a radiating focus of good will and their entrance into a room is as though another candle had been lighted. We need not care whether they could prove the forty-seventh proposition; they do a better thing than that, they practically demonstrate the great theorem of the Liveableness of Life.—Robert Louis Stevenson.

Here's a Stone Roofing

Plant of Robinson Clay Products Co., Akron, O., covered with J-M Asbestos Roofing for over twenty years.

Think how long it will last!

J-M Asbestos Ready Roofing is literally a sheet of pliable stone—with the lasting qualities of stone.

Also with the fire-proof, rust-proof, rot-proof and acid-proof qualities of Asbestos. And—like all stone—it *never* needs painting.

It consists of several layers of Asbestos Felt securely cemented together with alternate layers of pure Trinidad Lake Asphalt—both practically *indestructible minerals*. No stronger combination of element-resisting materials is possible. There is not a particle of perishable material in

J-M ASBESTOS ROOFING

We can tell you of many buildings—give you the names of the owners—on which this roofing, without any painting or other protection, has withstood the wear and tear of nearly a quarter of a century and is in good condition today.

If you wish to protect your buildings, at the lowest cost per year, from fire and all weathers; from heat in summer and cold in winter, get J-M Asbestos Roofing from your dealer. Sold direct (and applied, if desired) where we have no dealer. It is adapted for any building, anywhere.

This Curiosity Sent Free

So that you can see the curious rock which yields the long, soft, pliable, yet practically indestructible fibres from which we make J-M Asbestos Roofing-Theatre Curtains, Stove Mats, Fire-Brick Cement, and hundreds of other Asbestos Products, we'll send you a sample of the Asbestos Rock just as it comes from our mines—the largest in the world. Write our nearest Branch today for sample, and we'll also send you a sample of J-M Roofing and our handsomely illustrated Book No. G. 55

Hay.

Scott, Magner & Miller say:

Arrivals of hay for the week just ending amounted to 3450 tons; somewhat of a decrease from last week. The most of this consisted of alfalfa from the river banks.

Grain hay is now entirely cleared from the fields, and there may be very little hay shipped in by the railroads for the reason that the warehouses will have to be broken to obtain the hay, and further, it is found that the railroad situation is becoming a little stringent and cars are obtained for hay shipments with some difficulty. It would appear that a firmer feeling generally may be expected, and that prices on all varieties of good horse hay may be advanced.

There is a great deal of alfalfa offering from lands in the irrigated sections, and this alfalfa is not acceptable in our markets at this time of the season when we are receiving a better class of hay from the river.

Very little choice straw has been arriving and the market is decidedly firm.

Fancy wheat hay	19.00@20.00

Deciduous Fruit Market

SACRAMENTO, Cal., Oct. 7, 1911.

F. B. McKevitt, general maanger of the California Fruit Distributors, reports:

The following gives the number of cars of deciduous fruit shipped from all points in California for the week (7 days) ending Friday morning, October 6th, 1911:

Peaches—38 cars. The report for this week includes several cars of peaches that should have been reported heretofore. Owing to the failure of the car line to report this shipment at the proper time, the actual movement this week has been swelled by about eight cars. Salways are now nearly done. Another week will probably entirely finish them.

Plums—A few scattering shipments are still going forward. Belated reports received at this office would indicate the shipment for the week of ten cars, but as this is a mistake, and there are practically no plums now moving, this report will not appear as indicating the movement for the week.

Pears—91 cars. Contrary to expectations, the movement of fall and winter pears has been greater this week than last. The fruit continues to be of splendid quality. Shipment is now nearing its end, and will last but a few days longer.

Grapes—633¼ cars. Although this report indicates the foregoing as the movement for the week, it has been swelled by cars which should have been reported to us last week. The actual movement for the week was about 560 cars, consisting almost entirely of Tokays. There are a few Cornichons moving, but practically no Emperors. Some Malagas continue to go forward from the Fresno district, and will continue in limited supply for the next ten days or two weeks. Shipments of Tokays from Lodi remain about stationary, while an increase is noted from the American River district.

Our first considerable storm for the season appeared on the first of the month. Showers fell in several places, and in one or two sections grapes were injured in spots. It has been estimated that the shipment would be affected for this reason by about one thousand carloads. Many of the principal districts entirely escaped. At the present time the weather is everything that could be desired. Indications are favorable for its continuance.

Comparative statement of shipments for season up to September 30, 1911:

	1910.	1911.
Cherries	250½	216¼
Apricots	289¾	214½
Peaches	2,517¾	1,970¾
Plums	1,552½	1,357½
Pears	2,330	2,137¼
Grapes	3,186½	3,038
Sundry	12	6¼
Total	10,139	8,940½

Citrus Fruit Market

LOS ANGELES, Oct. 11, 1911.

Between 350 and 400 cars of Valencias shipped during the month of October will practically clean up the old crop. Just at present the market is exceptionally strong, caused by the dearth of fruit in the market which will be overcome within a few days by extra shipments

Diligence is the mother of good luck.
—Franklin.

and for some extra fancy stock a premium is being offered. The estimates of next year's crop are that it will be fully as large as the present one, and, so far as can be judged this early, quality will be excellent. The season has been very favorable.

Lemons are also strong and the few now in the market are picked up at top prices. Of course a few extra cars would overdo matters and prices would not remain as strong as at present, but there is no indication of any such shipments, and it is probable the next few weeks will see the maintenance of present firm conditions and good prices.

Shipments.

Shipments of oranges to date since November 1, 1910, 36,400, lemons 6,525, total 42,925. To same date last season: Oranges, 24,979, lemons 4,620, total 29,599.

NEW YORK, Oct. 9.—Nine Valencias and one lemon sold. Market firm on Valencias and higher on lemons. Weather fair.

OULD DOCTOR MA'GINN.

The ould doctor had only one failin,'
It stayed with him, faith, till he died;
And that was the habit av wearin'
His darby a thrifle wan side!

And twenty times daily 'twas straightened,
And try as he would for a year,
Not thinkin', he'd give it a teecher
A thrifle down over wan ear!

It sat him lop-sided and aisy;
It throubled his kith and his kin—
But ach, 'twas the only thing crooked
About our ould Doctor Ma'Ginn!

And now that he's gone to his Glory—
Excuse me a bit av a tear—
Here's twenty to wan that his halo
Is 'slantin' down over his ear!
—Arthur Springer, in Smart Set.

Did you ever meet a maiden fair
Who blessed you with a smile,
Then when you tried to favor her
She backed away a mile?
—Chas. H. Meiers.

Whoever needs a helping hand that I can give is my neighbor.

A GREAT ORGANIZATION.

(Continued from Page 339.)

"Fewer serious efforts are made now to break down the co-operative principle among the growers. New schemes of fruit marketing are proposed from time to time, the organizations are frequently attacked in the courts under one guise or another, and other insidious movements are started, all having in view the possible splitting open of the co-operative organizations and a return to the methods of marketing which would destroy the systematic distribution and marketing now in operation and reinstate the chaotic speculative methods that were formerly in vogue. The co-operative movement in the citrus industry is the result of a slow, painful evolution, and the grower does not appear to be deceived by these efforts, no matter how ingeniously and artfully they are conceived."

LEMON INCREASE.

In the report of Commissioner Beers of Santa Barbara County we note:

"New interest is being awakened in the lemon industry by the coming of outside fruit men who purchase interests now developed and make arrangements for enlarging the present acreage. Lands suitable for this purpose are being secured and arrangements are already made for more extensive planting in the early spring and summer. Considering the prices that have been obtained during the past two or more years, this line of development offers many attractions. The prospects are good for a much extended industry."

A POSTPONEMENT.

Southern California has two big attractions on Saturday of this week—President Taft and the Santa Monica Road Race. Of course everybody wants to see the far-famed smile; equally, of course, motor enthusiasts count on witnessing the road race which is one of the most exciting events of the local year. All signs point to Saturday as a busy day, so another big attraction to the prosperous rancher has been held over for one week. This is the sale of farm machinery, animals and equipment used during the past year in development work on the great Van Nuys and Lankershim ranches, northwest of Los Angeles. Messrs. Briggs and Weber of Los Angeles inform us that President Taft wired that if they held that sale on the day he is in Southern California he would have no audience, so they've called it off as a favor to the President. But on the next Saturday, Oct. 21, at nine o'clock, the entire outfit, horses, mules, and machinery, will be turned over to buyers at Van Nuys. All stock and equipment will be on view to prospective purchasers before the sale day, as may be seen, together with further particulars of this and other events of prime interest to dairymen and farmers, on announcement page of Messrs. Briggs and Weber in this issue of the Cultivator.

Vol. XXXVII. No. 16. LOS ANGELES: THURSDAY, OCTOBER 19, 1911 One Dollar the Year

The State Apple Show at Watsonville

A Successful Showing of California's Apples at the Second Exposition of the Watsonville Apple Annual Association. The Pajaro Valley Does Itself Proud.

"The greatest apple growing center in the world" has settled back to normal. The "Boosters of Boosterville" are drawing in a long breath while they rest their feet on the window sill and say, "By George, I'm tired, but it was the greatest on earth, and we done it!" Sure it was a great show, which has won the praise of the state, and even of some most worthy people of other states.

I refer to the Apple Annual, or the California Apple Show, held at Watsonville, in the Pajaro Valley, in Santa Cruz County, October 9-14, 1911.

But about that "biggest on earth" claim; let us analyze a bit. I recently heard an enthusiastic real estate agent lauding lands under a great irrigating system, and he remarked: "This is the greatest irrigating system in the world." And yet there is one other in this state which covers more than three times the acreage, and other states go us still better. We have become so used to brag of our biggest and tallest trees, the biggest pumpkins, the greatest and best citrus production, raisin production, wine production, all kinds of fruit production, we even admit the ownership of the greater part of the greatest ocean. We boast of all this—which is true,—I say, till anything which isn't the biggest yet is mighty small potatoes, or apples, as the case may be.

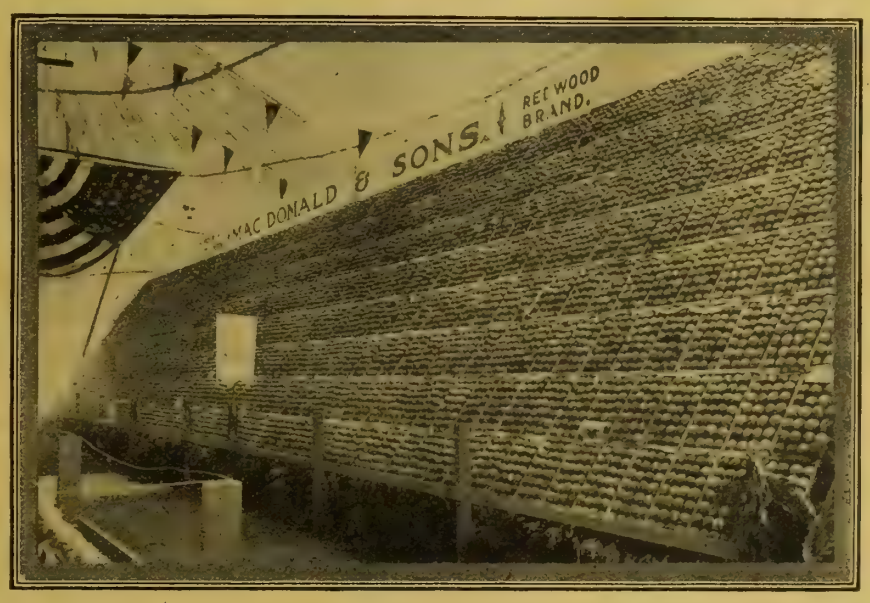
But about this apple show; let us consider a moment. It did not have on exhibition as many apples as did its predecessor on the same spot a year ago. Then there were twenty-six cars of fruit exhibited, and this year the total was much less, at least not over twenty-two or twenty-four. The full car entries were ten, as against fifteen last year. The one hundred and fifty box entries were also less.

But outside of quantity, mere bulk, it was a better, a greater show than its predecessor. The fruit was more carefully selected, it was better packed and better arranged. The industrial exhibit was far better arranged, the "Lane" had more shows and fakes, and, incidentally (and of interest to the management), on the whole it was financially most successful.

As to other exclusively apple shows, the Gravenstein at Sebastopol, the National at Spokane, the "International" at Denver, were all big and fine, but declared by many who attended them not the equal in all respects of this one. The Gravenstein show was a wonderful show and worthy all the praise given to it, but in the matter of quantity it probably had less than half the apples displayed here. Besides, it was not so exclusively an apple show. There were Burbank's and other most interesting exhibits, some of general dried fruits. Here at Watsonville I noted the exclusiveness of the show, and remarked to a resident: "It is exclusively apples; not even a pear is on exhibition." "Oh, yes, there is," he said, and proceeded to show me, on the sands in front of the apple-constructed miniature of the Santa Cruz Casino, wax dummies of a "pair" of spoonies under a beach umbrella.

As to the Valley being an apple producing center, there is no other place in the world where the apple is produced where it is so specialized as here. I make this statement arbitrarily, and perhaps cannot produce the proof, but will ask any challenger to produce his proof to the contrary. Some may ask as to Hood River. If Hood River should add to its output all the rest of Oregon's output, and to that all the shipments of the state of Washington, the two states would still lack many cars of coming up to the little Pajaro Valley's total output. Of course, Hood River has produced some remarkably fine apples, a remarkably fine pack, and good advertising, but not the quantity of apples. Besides the apple shipments, which utilize the energies of ninety-six packing concerns, there are three vinegar and cider factories, eighteen evaporators and a cannery.

California needs a few more shows like that at Sebastopol and this one to convince Californians that their own state is on the apple map.



A Car Lot Exhibit.

About the Show.

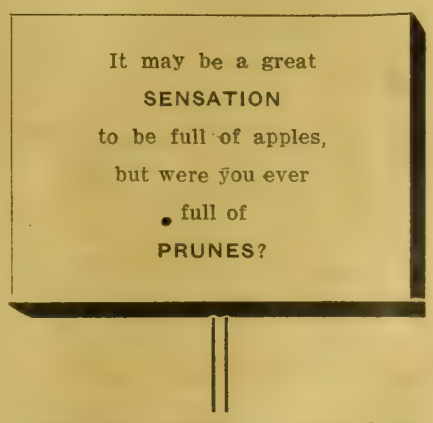
The week began with a drizzling rain. There was no blue in the sky, but more than enough to make up in the dispositions of the directors. By Monday afternoon the sun and the directors smiled. Tuesday the weather was perfect, Wednesday more so, Thursday most perfect, and to the superlative was added each day, till by Saturday even California in her sunniest mood could have done no better.

And the crowds came and saw, and carried away souvenir canes and things, and bought cider, apple pie, popcorn crisps, taffy and tickets to the Lane, where they were in turn sold, and seemed to enjoy even the latter.

What They Saw.

The exhibits not only filled the pavilion, but two immense tents, one for car exhibits and the other for the orchard implement and industrial section. The center of the pavilion was given over to the feature exhibits. A feature exhibit is one put up by a firm, association, community or county, in which ingenuity, artistic taste, and in this case apples, combine to produce striking effect. The fruit may be inferior, but the feature must have attractiveness, and a surprise if possible. Dried apples combined with fresh fruit in producing the remarkable results, an idea of which may be had from engravings shown on these pages.

As one entered, the first feature was the Panama Canal done in dried apples by students of Watsonville High School. It was about 10x35 feet. The mountains and plains were of dried apples, the marsh lands of green Newtowns, and the Chagres River and the Canal of real water of the Pajaro. The Stewart Fruit Company flung to the breeze a banner with the device, "Pajaro Valley Apples the World Over," but only showed a hemisphere covered with them. The San Monte went them a half better, and showed the whole globe, the continents of fresh whole apples and the seas of overlapping evaporated apples. The globe revolved constantly, while an electrically operated tapper working about as fast as a watch ticks, a gong striking every ten or fifteen seconds, and a chime operating every hour or so, announced the consumption of an apple, a box or a car of Pajaro Valley apples "the year around, the world around." Hard by was the San Jose electric light tower in miniature, though not so miniature either, for it towered up to the roof, and was covered with apples to show that the Santa Clara Valley is some on apples as well as prunes. She couldn't get away from her prunes entirely, though, for I noted on one of her banners in the Wednesday parade:



That was carried by one of Mr. Brooks' boosters of the "greatest chamber of commerce on earth."

Five buildings were done in apples, all remarkably well done. They were the Casino at Santa Cruz, the Watsonville Y. M. C. A. building, the old 'dobe customs house of Monterey, the Appleton Hotel, now building at Watsonville, and the Salinas sugar factory. Another building well done, but not a facsimile of any other, was a cottage surrounded by a model farm in 1923. The spraying was by aeroplane (Ortho sprays, of course), and other farming transactions on a similar high plane. An apple tree several years old and heavily loaded with fruit was taken up root and branch and transplanted to the show, and attracted much attention, as did the "latest from Paris," a lady's hat of dried apples, fresh apples and leaves. Being so reduced in size, only four feet in diameter, it was hardly recognized as a modern hat.

The Fruit.

The ten full car exhibits were beauties. Two cars were arranged on one form like a mammoth letter A. Up each side of the A the boxes were tiered end to end, eight high, and seventy-two boxes in each rank. Some were "straight" cars, all one variety, others mixed varieties.

The one variety car was by far the most attractive. The fruit was surfaced beautifully, most of this showing magnificent pack, and one judge told me the fruit graded very well through the pack. In judging, ten boxes were dumped, and each fruit of the ten boxes examined carefully. Every scale and every worm found in these ten boxes, as well as every defective fruit, causes heavy cuts in the score.

The plate exhibits were instructive in that they comprised scores of varieties, and on each was a card with name of variety.

County Exhibits.

Exhibits from other counties or sections were not large, but sufficient to prove that the Pajaro Valley may well watch out or it will not be the only apple on the limb. There are others coming. Even far away Modoc staged out enough of her apples to make a fine little showing. Near by was her neighbor, Butte, with some magnificent King Davids, Delicious, Winter Bananas, Black Twigs and a dozen others, mostly of the deep red varieties. Tuolumne? Yes, Tuolumne was there with a great quantity of King Davids and many other varieties. For spectacular appearance those mountain apples are stunners. As to eating, the best "York State" apple isn't in the running—they taste like more. Pass the King Davids again, please.

Southern California came up from San Bernardino County, Yucaipe, or rather Oak Glenn, near Redlands. This exhibit was between those of Tuolumne and Butte, and all three exhibits held a crowd constantly. Every apple richly colored and a beauty. The Paso Robles section exhibited a dozen varieties, all presenting a fine appearance. Humboldt makes its maiden effort in a good sized exhibit. The fruit is rather large, but shows quality. Humboldt is not a very far away neighbor of Sonoma. Both are old apple producers, and both are beginning to realize their strength along that line.

BUY CITRUS TREES

Buy your Citrus trees of the LARGEST AND BEST EQUIPPED NURSERY IN THE WORLD. Now is the best time to place your order for spring planting. Be sure to get your order in while first-class stock is available.

If you have never planted Citrus trees, consult with us. With suitable soil and climatic conditions there is no crop that will equal a well developed Citrus orchard.

Our booklet entitled "Citrus Fruits" mailed to any address on receipt of 25 cents; credit given for this amount on first order.

Citrus and Tropical Fruits

HAIRY VETCH.

By M. L. Fisher, Purdue University Ag. Ex. Sta.

Within the past year or two there have been printed in farm papers a number of articles testifying to the value of vetch as a green manuring plant. These results seem to be well corroborated. The Purdue University Agricultural Experiment Station has been growing vetch for several years, and since many inquiries have been made concerning vetch, this brief statement is made concerning the plant.

Hairy vetch is a legume belonging to the same family of plants as the clovers, soy beans and cow peas. It is also known by the names of winter vetch and sand vetch. The plant has beautiful purple blossoms gathered in a cluster, compound leaves with six or eight leaflets, and weak stems. The roots are fibrous and rather coarse. The plant has a tendency to grow throughout the summer, having ripe seed and blossoms on the stem at the same time. The plant seems to be adapted to all types of soil, preferably the clay loam, well drained.

Land for vetch should be plowed and prepared the same as for sowing wheat. Thorough disking may also make a good seed bed, depending upon conditions. Vetch may also be sown in standing corn. The sowing is best done with a drill, sowing from forty to sixty pounds of seed per acre. The month of August is preferable for sowing, although early September sowing may also be satisfactory. After sowing, the crop will need no further attention. The plant starts growing early in the spring and makes rapid growth, and is ready to pasture or turn under by the middle of April, at which time the growth should be as much as twelve to eighteen inches in length.

Hairy vetch is probably better for green manuring than for any other purpose, although some farmers have had good results from pasturing it with hogs and cattle. However, some farmers have found that their animals do not relish the plant as a pasture. If rye is sown with the vetch it tends to hold the vetch up, and the crop may be cut for green feed at about the time the rye is beginning to head. It makes very good feed for dairy cattle.

In 1910 the Station obtained from a mixture of rye and vetch, green weight of six tons per acre, equivalent to about two and three-fourths tons of dry hay. In 1911 the yield was eight and one-fourth tons of green weight, equivalent to about three and one-half tons of cured hay. Vetch sowed alone this year made a green weight of nine and three-fourths tons per acre.

The vetch plant, like other legumes, has an abundance of nodules on its roots when the ground is well inoculated. In some cases the plant produces nodules the first time sown. In other cases the nodules do not appear and inoculation seems to be necessary. It seems wise to sow a small area for one or two years until inoculation is obtained, and then use this soil to inoculate larger areas. The plant is so little grown that inoculated soil is not easily obtained, and in most cases it is probably not needed.

The Experiment Station in its work has noted two things concerning hairy vetch which seem to be against it. One is that it has a tendency to winter kill, some winters killing badly, other winters not very much. There is also a tendency for the plant to escape from cultivation and become a weed. As a weed it will do no harm except as it may appear in wheat fields, where it will grow and mature with the wheat, and the seed being threshed cannot be easily separated from the wheat.

The Experiment Station believes that the crop merits further consideration by the farmers in the state, and suggests that the beginner operate on a small scale until he is convinced that it is something that he wants.

ORANGES IN OTHER COUNTRIES.

By G. Harold Powell, in Circular No. 4, Citrus Protective League.

A citrus fruit grower from the Transvaal has recently been in California studying the methods of handling the California citrus fruit crop, and to secure appliances to be used in the handling of the crop in the Transvaal. They are beginning to ship oranges from the Transvaal to the United Kingdom in considerable quantities during the summer months, the season when the fruit ripens in that country. The haul by rail to the South African coast, usually to Cape Town, may reach a distance of 1,000 miles. According to data furnished by the grower mentioned, the fruit is being carried by the railroads during the present season to the point of export at the rate of 15 shillings per ton (13.1 cents per box of California size); it costs 5 shillings per ton (4.4 cents per box) for dock dues and loading charges, and 25 shillings per ton (22 cents per box) to Southampton, a distance of 6,000 miles, making a total cost of transportation of 39.5 cents per box of California size for a distance that may equal 7,000 miles. The fruit is carried the entire distance without refrigeration. With a rate of 25 to 30 cents a box from Southampton to New York, which is the usual rate on foreign citrus fruits, the South African grower, 10,000 miles distant, can land oranges in the Eastern United States at a lower cost of transportation than the grower in California.

Oranges in Mexico.

There is considerable activity in citrus fruit planting in Mexico. According to the Daily Trade and Consular Reports, Sept. 7, 1911, "the shipment of oranges from San Luis Potosi, Mexico, to Chicago will commence about Sept. 20, 1911, and it is now estimated that a total of about 55 cars will cover the season's exports, as compared with 34 cars last year. These oranges all come from the Rio Verde Valley, in the south central part of the state. The freight from Rio Verde to Chicago is $1.25 gold per 100 pounds, and customs duty $1 gold per 100 pounds (which total $1.91 per 85 pound box), but they reach the American markets so early in the season that good prices are obtained."

Oranges in Spain, Italy and Other Countries.

The exports of oranges from Spain in 1910 amounted to 1,051,764,067 pounds; from Italy, 265,498,285 pounds, an equivalent from both countries of more than 55,000 carloads of California oranges.

More than 50 per cent of the Spanish oranges are shipped to the United Kingdom, and from 15 to 20 per cent go both to France and to Germany. The exports of oranges from Spain have increased 67.2 per cent in the last ten years. The freight rate on Spanish oranges to the United States is about 30 cents per box. It may be as low as one shilling (24 cents) per case, equal to 2½ California boxes, to the United Kingdom. The oranges from Italy are exported principally to Austria-Hungary, Germany, Russia and the United Kingdom in order of importance. The exports of oranges from Italy have increased 59.4 per cent in the last ten years.

The exports of oranges from Jaffa in 1910 amounted to 900,000 cases, valued at $1,136,794. Most of these oranges are shipped to the United Kingdom, with smaller quantities to Russia and Egypt. The exports from Jaffa have increased 149 per cent in the last ten years.

The exports of mandarin oranges from Japan in 1909 amounted to 22,245,897 pounds. The oranges from Japan are shipped principally to Asiatic Russia, Corea, Kwantung Province and British America, in order of importance. More than half a million pounds were shipped from Japan to the United States in 1909. The exports of mandarin oranges from Japan have increased 605 per cent in the last ten years.

Does More Work Than 40 Men

Read the letters in our free book to prove it. No machine ever invented that equals this 20th Century Grader on all work of grading and leveling roads, building ditches, levees, borders, irrigation laterals, leveling land, cutting sage brush and weeds, scalping alfalfa, cleaning streets and sidewalks and its many other uses.

Makes and saves big money Originalone-man machine. Thousands in use—all giving splendid service and satisfaction.

20th Century Grader

is built of steel—lasts a lifetime. Many important features and advantages that make it the most wonderful grader ever built. Weighs only 600 pounds. Write postal now for most interesting book you ever saw.

Unless a man amounts to a good deal, he should not say he has done his best.—E. W. Howe.

Every orange producing country in the world is interested in the effort of the importers of lemons in New York and the exporters in Sicily to have the duty removed from citrus fruits. We may expect that each of these countries, which pays a low wage to labor and a low rate of transportation, will prepare to ship its citrus fruits to the United States if a low rate of duty should be established.

Lemons in Europe and Prices in New York.

There has been an unusual demand for lemons in European countries during the year 1911. This demand has been increasing steadily for ten years, and in 1911 it has had a marked effect on the international shipment of lemons.

The California crop in 1910-11 is the largest in the history of the state. Nearly twice as much fruit has been shipped into Eastern markets as in 1909-10, and the large increase over the crop of the preceding year has reduced the price of lemons to an unusually low level. Heretofore, the Eastern markets have been controlled by the importers of Italian lemons, and each year since 1885 the wholesale price has been forced at some period during the summer months from $6 to $12.50 per box. On account of the increase in the California crop in 1911, and the freer shipment of the fruit to Eastern markets, the wholesale price of 132,738 boxes of Italian lemons in New York in August, 1911, averaged about $2.60 per box, an average of less than 10 cents per dozen. The average wholesale price of 143,986 boxes of Italian lemons in New York in August in 1910, when the California crop was much lighter, was $3.67 per box.

In an effort to hold the prices high the importers have endeavored to create a scarcity in the Eastern supply of lemons. They have been reshipping lemons to Europe since the first of August and have withdrawn the fruit from the auction sales in New York whenever the price has been unusually low. Mr. Sciortino, a prominent New York lemon importer, is quoted as saying that some of the exporters in Sicily would probably not permit the sale of lemons in New York at a price below $4 a box wholesale on account of the higher prices in Germany and England, where, in referring to Germany, Mr. Sciortino states that "buyers there are willing to pay relatively higher prices than can be obtained in the American markets."

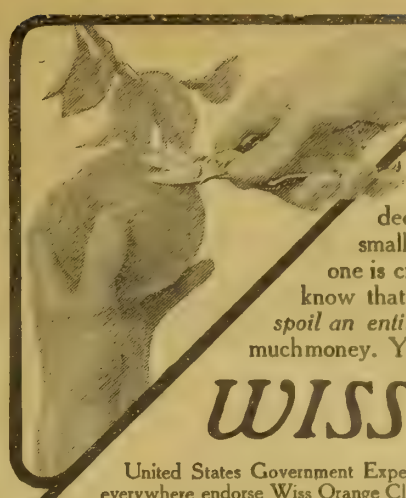
Equivalent Rates of Duty.

There is a duty equivalent to 1 cent per pound on citrus fruits in Australia; 1.84 cents maximum and a free conventional duty on lemons, and 2.2 cents on oranges in Austria-Hungary; 79-100 of a cent on oranges and lemons in Belgium; 79-100 of a cent in Denmark; 1¾ cents in Finland; 1.3 cents maximum and 44-100 of a cent minimum in France; 1.3 cents maximum on oranges and lemons, 35-100 of a cent minimum on oranges and a free conventional duty on lemons in Germany; 2.43 cents maximum and 24-100 of a cent minimum in Norway; 44-100 of a cent maximum and 44-1000 minimum in Roumania; 2.25 cents maximum and 1.42 minimum in Russia; and 1.21 cents in Sweden. There is no duty on citrus fruits in Argentine, Canada, England or Switzerland. With the exception of Australia, which produces citrus fruits, these duties are levied for revenue only. Mexico formerly granted a bounty of 85 cents per 1,000 lemons and $1 per thousand on oranges exported to encourage the planting of these fruits; and Italy fixes a minimum price to be paid the producer for citrate of lime, into which 40 per cent of the Italian lemon crop is converted, and fixes a minimum selling price as well.

IN THE DEPARTMENT STORE.

Said a New York shopper: "He wanted a copy of 'Tales From Shakespeare,' by Charles and Mary Lamb. As he was in a great hurry, he cut the title down and asked the clerk at the book counter of one of the large department stores whether she had 'Lambs' Tales.' He said he would never forget the far away look she gave him as she remarked, in a most superior tone:

"'Lambs' tails? Fur department—third floor.'"



Stop *Bruising* Fruit and *Losing* Money.

Every time your clippers pierce an orange's skin you open the way to decay. Usually the cut is too small to *notice*—and the bruised one is crated with the good. *You* know that *one decaying orange may spoil an entire crate*—you lose just that much money. You *won't* bruise fruit if you use

WISS ORANGE CLIPPERS

United States Government Experts and leading citrus growers everywhere endorse Wiss Orange Clippers because they *know by experience* Wiss Clippers *last longest, do best work* and *save money* by *minimizing* the liability of bruising the fruit.

The blades are specially curved and ground—the points and outer edges are smoothened and rounded to avoid bruising. Handles are shaped to prevent tiring of the hand. Wiss Orange Clippers will give years of service—and are unrestrictedly guaranteed to give satisfaction. *For sale by all dealers.*

Wiss Solid Steel *Pruning Shears* will snip a broom handle and cut the most delicate tendrils. All parts are interchangeable and any broken parts can be readily replaced. 9-inch size, $2.25.

305-306 Union Trust Bldg. LOS ANGELES

MAN MUST EAT

There is money in

SUGAR and CATTLE

Share in the profits of an agricultural investment, comprising over 21 square miles of rich agricultural lands.

The land has an abundance of water in a district where irrigation, drought and frosts are unknown. Large tame grass pastures have just been prepared.

The land is free from incumbrances, which affords our investors the highest degree of security.

THE PRODUCTS OF THE RANCH ARE CATTLE AND CANE SUGAR, TWO OF THE WORLD'S BIGGEST DIVIDEND PAYERS, AND ON WHICH THE MARKET IS STEADILY ADVANCING.

In this district lean cattle fatten in four months in tame grass pastures and increase 50% to 100% in value.

Cane sugar is manufactured at one-third the cost of beet sugar.

Additional capital is required for improvements and to buy cattle to stock the ranch. A limited amount of investment certificates will be issued in units of $100 cash or on installments. Six per cent per annum interest is guaranteed, and we also share the profits with you. Option given to withdraw your money and profits or to become a part owner of this great property.

Applications for certificates will be filed in the order received. This enterprise is backed by some of the most substantial and well-known business men of Los Angeles. We invite the strictest investigation.

Send for free booklets and descriptive literature.

Notes of the Apple Show

The surrounding communities closed shop and joined with the Pajaro Valley in a general neighborly contest. Watsonville boosters had visited other communities and made the invitation so extended and warm-hearted that from San Jose to Salinas and Monterey the acceptance was as hearty as the invitation.

Prize Winners at This Year's Apple Show.

San Jose boosters joined in the great celebration and parade on Wednesday, 500 coming fifty miles in a special train.

The judges put in good long hours at their work, and we believe more conscientious work would be impossible. The names of the judges were given in last week's paper.

The packing houses of the city received many visitors during the show, occasion being taken by outsiders to observe how great quantities of apples are handled.

The Awards.

The quality awards were:

CARLOAD LOTS.

Sweepstakes—Best car single variety in the show—"Pride of Pajaro Valley Brand", Alaga Bros., Watsonville. Best car Red Winter Pearmains.

Newtown Pippins—1, Gospodnetich & Zegar; 2, Earl Fruit Co.

Bellflowers—1, L. S. Bradley Co.; 2, B. Pista & Bros.

Mixed Variety—1, Loma Fruit Co..

100-BOX LOT.

Sweepstakes—Best 100 boxes in the show—M. L. Kalich & Co., Watsonville.

Bellflowers—1, M. L. Kalich & Co., Watsonville; 2, Stephen Scurich, Watsonville.

Mixed Variety—1, Nick Banaz, Templeton; 2, A. Balich Fruit Co., Watsonville.

Newtons—1, Frank Radovan, Watsonville; 2, H. T. Davis, Watsonville.

50-BOX LOT.

Sweepstakes—Best 50 boxes in the show, Frank Radovan, Watsonville.

Red Pearmains—Frank Radovan, Watsonville; 2, Ewell Fruit Co., Santa Cruz.

Newtons—1, Milanovich & Pista, Hollister; 2, Copriviza & Gera, Watsonville.

Bellflowers—1, Gospodnetich & Zegar, Watsonville; 2, Stephen Scurich.

Mixed Variety — 1, Martin Bros., Watsonville.

Langfords—1, Yoke & Way Co.

Watsonville Poultry Show

WATSONVILLE POULTRY SHOW.

The aristocrats amongst the feathered tribe gathered in Watsonville during the Apple Show to the number of some 700. There were no pigeons exhibited, but the poultry breeds had a most generous representation. The judging was by Mr. Geo. D. Holden of Minnesota, one of the old-time and best known judges who gave the exhibitors information as to pure-bred poultry, and his awards were received with general approval. The display of cuts was one of the finest in the state. We heard many compliments for Superintendent Lewis of San Jose who cooped the show. On the whole, the show was a credit to the management of Mr. Andrews of Watsonville who was its inspiration and its hardest worker. The awards were:

The Awards.

Young Pekin Ducks—Ckl.—1 and 2, Smith. Hen—1 and 2, Lee; 3, 4 and 5, Bliven.

Buff Cochin Bantam—Pen—1, E. Lisle Keesling. Ck.—1; Hen—1 and 2; Pullet—1, Dr. W. J. Ramsey.

One of the notable exhibits was Pet McClave, a Buff Orpington, declared by Chas. McClave, formerly president of the National Association, one of the finest birds he had ever seen. In color the bird is almost perfect and from the fancier's standpoint worth an even $1000, but that amount would not purchase her from the present owners, Mr. and Mrs. W. S. Sullivan of Agnew.

POULTRY MANURE IN GARDEN.

Gardeners should use a little discretion in the use of poultry manure. Either fresh or raw, there is a possibility of using it in excess, and there are few gardeners who are so overstocked with this excellent fertilizer that they can afford to needlessly waste it. It should always be well mixed in with the soil by continuous working, and repeated plowing and harrowing will accomplish this if done persistently. Manure and plenty of it is the key to success in gardening, but with poultry manure too little is better than too much.

Plan to plant crops that live from year to year, like asparagus, rhubarb, strawberries and the like, at one end, so that they will not interfere when you cultivate the annual vegetables.

Keep the cultivator going through both orchard and garden.

Two essentials are necessary for the rapid maturing of vegetables—a soil made light with sand, and rich with well rotted manure, and a wind break.

Easy Money For the Dairyman

Your money comes directly out of your cows. It makes a wonderful difference to your pocketbook whether your cows produce much or little. Have you ever realized what even one quart a day more from each cow means to you? Say three cents a day—that's more than $10 a year. With only ten cows it means $100 a year. Looks pretty big all in a lump, doesn't it? Now it's just "easy money" to get that extra quart, and oftentimes two quarts, by a simple and cheap change in your feed.

We are blessed in this country with nature's richest gift—"Alfalfa," which we all agree is an unrivalled feed for a dairy cow—but even the best should not be used alone—cows, just like human beings, need variety. Alfalfa is rich in protein, but is light in carbohydrates. A cow, in order to make the most milk, must have in her ration a sufficient amount of both classes of feed.

In Steam-Dried Beet Pulp is found the ideal combination with alfalfa to make a properly balanced ration. It is light, bulky, succulent and easily digested, absorbs water very quickly and swells to about six times its original bulk. It is cheaper than bran or rolled barley and produces better results.

The combination we recommend is 8 lbs. of Steam-Dried Beet Pulp with all the alfalfa hay the cow will eat, which will be from 15 to 20 lbs. daily. It has also proven to be a splendid green food for poultry. They are extremely fond of it.

STEAM-DRIED BEET PULP
Just Like Roots
Makes More Milk

Steam-Dried Beet Pulp is just the clean beets from the sugar factories (only the sugar extracted), which is **dried by steam.** Be sure you get the kind that's **steam dried,** always uniform in color and quality, never burned or blackened by smoke, always clean and pure. It is packed in 100-lb. sacks and will keep indefinitely.

Progressive feed dealers are rapidly placing Steam-Dried Beet Pulp in stock. Ask your dealer for it. If he does not keep it, write us. We will see that you are supplied promptly.

Live Stock and Dairy

Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.

EFFECTIVENESS.

By Mrs. M. E. Sherman.

What qualities do we wish in our cows and how shall we secure them, are ever present questions. What are the desirable qualities? Twenty years ago I would have named a long list, but now I know that one grows out of the other, and all are bound up in a few necessary foundations. First of all in the herd, health is of paramount importance; next, productiveness of offspring; third comes the large flow of rich milk, and fourth, good looks. Now to consider these points briefly. Good health is placed first because unless a cow has vigor we will have nothing to pin the other qualities to. A sickly cow might as well be a dead one if we are running a herd for profit. Good health is founded on good digestion and proper assimilation of nutriment. Now a cow with a weak digestion can never be a great producer, for without food, milk can not be produced, and if the food is not consumed the cow is not fit to be in the herd and should be eliminated. Health must be built up by a constant and abundant supply of palatable food, as the foundation laid in youth establishes the habit of health.

Disease.

The freedom of a herd from tuberculosis and aborting is largely a matter of care in keeping out and removing diseased animals. They are easier to keep out of the herd than they are to cure. Tuberculosis can be cleaned out of a herd with small sacrifice if it is taken when the first evidence is discovered, the herd then carefully tested, and tuberculin diseased animals removed. The testing continued twice a year will soon end the trouble. Then only tested sires are added and nothing is likely to bring it into the herd. Aborting is deadly destructive to the herd. I really think that the avarice of the sellers of cattle has been the cause of this trouble, reaching to the remote ranches all over the coast. In many places the cows lose their calves several times in the fields before it is discovered. Then, too, there are herds in which the trouble seems to be chronic and the calves are dropped very weak and soon die of a form of white scours.

Shy Breeders.

There are in every herd a few shy breeders. These must be made into beef, as they eat up the profits. In a herd of fifty there may be two or three that have a calf every other year and are dry for several months. The heifer calves of these cows are apt to have the same habit increased in them, or be "worser," as the children say. Without health and without proper increase the herd is doomed.

Rich Milk.

The third desirable quality is large and rich flow of milk. Health with abundant feed is necessary to a cow in producing a flow of milk. A cow can not make milk without feed any more than the Hebrews could make bricks without straw. Like the Hebrews she will go if forced to try it very long. The milk flow has been bred into our modern cows by selection of the sons of the heaviest producers to head the herd. Inheritance of qualities and why one animal should inherit one way and another another way, has long puzzled scientists. In the human family the microscope has come into use to find the chromosomes of the living cells. It has been found that in the cells from any part of the human female these chromosomes number twenty-two, while from the human male they number twenty-one. Now these are inherited by the children, one-half from each parent, and bring out an infinite variety, as they are confused into bundles of inherited qualities. I give this theory for consideration but am not at all sure that it will bear the test of further investigation by the Carnegie people. If this proves to be true then it will explain the why of the passing of the acquired quality of a milk flow through the son to his daughters so freely, and of the same quality passing so slowly through his sons to their daughters.

The sire gives half the inheritance toward butter and milk production. Now if his dam has been a great cow he has a stronger inheritance to pass than if she has been merely a "cow." This butter quality the cow can absorb in a full degree and if she is a half way individual toward goodness, she will pass it on to her heifer calves in an increased ability. Now continued testing and weeding out of the weak in health and the poor producer for five or six generations, and continually pouring in an increased amount of prepotent blood on the male side, will bring the herd up rapidly. Prepotency or the "before force," will push the herd into production just as fast as general health can be built up to stand the strain. Function does modify form, it strengthens it, to withstand the pressure. I have frequently to tell purchasers that are just starting into the dairy business with ordinary cows that a sire from a thirty pound in seven days cow will not give them any better results than a sire from a twenty pound one. Why? Because the sire may have the force, but if the cow has not the strength it will not go. You may hitch a mule to fifty tons, but no matter how determinedly the mule tugs the load will not move. The sire is the mule trying to move the inert mass of the cow's lack of acquired form. Let the same sire be bred to a cow of like quality and the offspring hardly ever fails to be superior.—M. E. Sherman.

A SAILOR AND FOUR HORSES.

Jack London admits that when he tackled a team of four horses he knew nothing more about it than when he undertook to sail the "Snark" across the Pacific ocean. "I taught myself as I sailed," he writes in Sunset Magazine for September, "and what I knew about horses, much less about breaking them, was just as much as any sailor knows. But when Charmian and I decided it was about time we knew what we had in our own county and the neighboring ones, I threw my chest out and my shoulders back. 'What man has done, I can do,' I proclaimed grandly, and I went at it. My greatest trouble was with Prince, a many-gifted love horse from Pasadena. Prince is not vicious; he is merely a good-natured rogue, who shakes hands for sugar, steps on your toes out of sheer excessive friendliness and just goes on loving you in your harshest moments. But he will not get out of the way of the wheelers. Also, whenever he is reproved for being in the wrong, he accuses Milda of it and bites the back of her neck. So bad has this become that whenever I yell 'Prince!' in a loud voice, Milda immediately rabbit-jumps to the side, straight ahead, or sits down on the leadbar. All of which is quite disconcerting. Picture it yourself. You are swinging a sharp, down-grade, mountain curve, at a fast trot. The rock wall is the outside of the curve. The inside of the curve is a precipice. The continuance of the curve is a narrow unrailed bridge. You hit the curve, throwing the leaders in against the wall and making the pole-horse do the work. All is lovely. The leaders are hugging the wall like nestling doves. But the moment comes in the evolution when the leaders must shoot out ahead. They really must shoot, or else they will hit the wall and miss the bridge. Also, behind them are the wheelers and the rig, and you have just eased the brake in order to put sufficient snap into the maneuver. If ever team-work is required, now is the time. Milda tries to shoot. She does her best, but Prince, bubbling over with roguishness, lags behind. He knows the trick. Milda is half a length ahead of him. He times it to a fraction of a second.

Warranted to Give Satisfaction.
Gombault's
Caustic Balsam

Has Imitators But No Competitors

A Safe, Speedy and Positive Cure for Curb, Splint, Sweeny, Capped Hock, Strained Tendons, Founder, Wind Puffs, and all lameness from Spavin, Ringbone and other bony tumors. Cures all skin diseases or Parasites, Thrush, Diphtheria. Removes all Bunches from Horses or Cattle.

As a Human Remedy for Rheumatism, Sprains, Sore Throat, etc., it is invaluable. Every bottle of Caustic Balsam sold is Warranted to give satisfaction. Price $1.50 per bottle. Maid, in the wheel, over-running him, naturally bites him. This disturbs the Outlaw, who has been behaving beautifully and she immediately reaches across for Maid. Simultaneously, with a fine display of firm conviction that it's all Milda's fault, Prince sinks his teeth into the back of Milda's defenseless neck. The whole thing has occurred in less than a second. Under the surprise and pain of the bite, Milda either jumps ahead to the imminent peril of harness and lead-bar, or smashes into the wall, stops short with the lead-bar over her back, and emits a couple of hysterical kicks. The Outlaw invariably selects this moment to remove paint. And after things are untangled and you have time to appreciate the close shave, you go up to Prince and reprove him with your choicest vocabulary. And Prince, gazelle-eyed and tender, offers to shake hands with you for sugar. I leave it to anyone; a boat would never act that way."

MOST PROFITABLE FEED FOR PIGS.

Three lots of alfalfa pastured pigs were fed respectively one-half, one and one-half and two and one-half pounds of corn daily for every hundred pounds of pigs. Those fed the least grain made the largest net gain in proportion to grain consumed, but they gained more slowly, and at the end of the test had a more stunted appearance. The daily profit for each pig was larger with those fed the next highest grain ration, and the largest with those fed the most grain. In another experiment, three lots of thirty pigs each were fed respectively one pound, two pounds and a full ration of grain daily to each 100 pounds of pigs. The pigs on light grain feed required 230 days to fit for market, and gave a profit on the grain fed of $179.40. The pigs on medium grain took 221 days, and gave $179.01. Those on full feed were ready for market in 165 days, and gave $168.30 profit, showing but a small margin to cover risk, labor, interest and extra alfalfa required in keeping the pigs the longer time on the lighter grain feed.—Field and Farm.

BUTTER SCORING CONTEST.

By Leon Davis.

If the butter sent to the fifth scoring of this year is representative of that which the competing creameries are furnishing their respective markets, the quality of California butter is much better now than in August. Out of a total of twenty-one entries, 66 per cent scored 93 or above, as against 20 per cent at the fourth entry, and a permanent improvement of this nature is what our creamerymen must work for. The results of this scoring show the highest average for the year, and that our California buttermakers can make good butter if only given good cream to work with.

The scores as placed by Mr. W. B. Thurston, Federal dairyman, Mr. E. H. Hagemann, of our dairy department, and the writer were as follows:

Creamery	Location	Score
Laton Co-op. Cr.,	Laton	95
University Farm Cr.,	Davis	94¾
Grizzly Bluff Cr.,	Grizzly Bluff	94½
Suisun Creamery,	Suisun	94
Visalia Co-op Cr.,	Visalia	94
Cal. Poly. School,	San L. Obispo	94
Dairy Delivery Co.,	Gustine	94
Cottonwood Cr.,	Cottonwood	93½
Ceres Creamery,	Ceres	93½
Dairymen's Co-op. Cr.,	Tulare	93½
McFarland Cr.,	McFarland	93½
Sta. Ysabel Cr.,	Paso Robles	93
Salinas Cr.,	Salinas	93
Glenn Co. Cold Storage,	Weltons	93
Riverdale Co-op. Cr.,	Riverdale	92½
Delta Creamery Co.,	Imperial	92
San Ramon Valley Cr.,	Danville	92
Berkeley Butter Co.,	Berkeley	90½

One of the most common criticisms offered on flavor was a light, undeveloped or flat flavor. The cooler weather in many parts, and the fact that the buttermakers have not become adjusted to the changed condition, may account for this. One of the entries criticised for a flat flavor was found to contain but .52 per cent salt, an amount too low, unless catering to some special market, as salt is necessary to bring out the desired flavors. A few pieces gave evidence of feed flavor, a defect for which the buttermaker is not responsible. The feeding of turnips and other related feeds in such quantities as to taint milk and cream is a condition which can be remedied only by dairymen, and we must look to them to help overcome this defect. The churning of cream produced under the most sanitary conditions results in bad tasting butter if it is tainted with feed flavor. Probably one of the most satisfactory ways of overcoming feed flavors is by pasteurization.

Of special interest to the competing buttermakers is the outcome of this year's work, closing with the next entry, which will be called for about the middle of November. Better support has been given this year's contest than heretofore, and a total of 40 buttermakers have participated at the various scorings. Several from smaller plants whose supply is low both in quantity and quality, deserve special mention for their efforts, as they have sent an entry each time, the scores on which have been rather discouraging. Present indications are that the race for prizes will be close as there is now but one-half point difference between the two highest individual averages.

Prizes for 1911.

There will be three prize cups for those having the three highest averages, respectively, of the six separate scorings during the year.

A special prize cup will be awarded to the individual sending either five or six consecutive entries showing the most marked improvement in methods and quality.

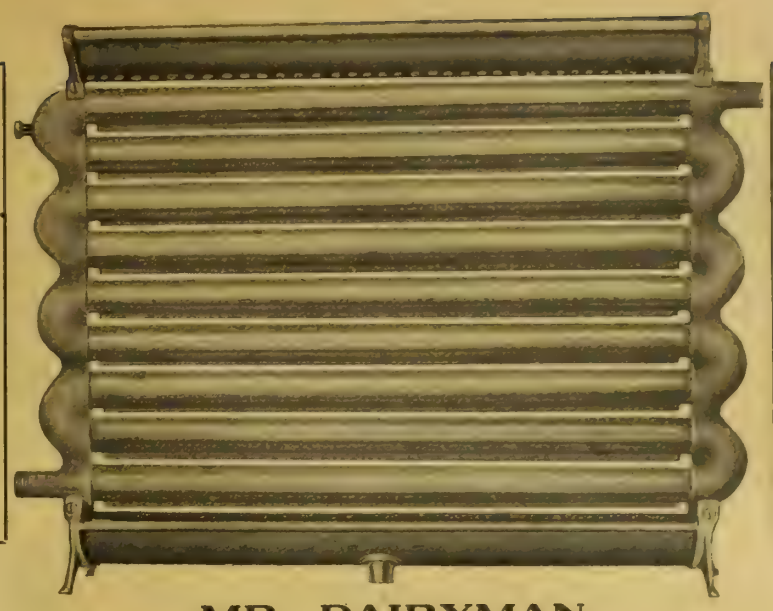
A silver butter trier will be awarded to the individual having the highest average score on five consecutive entries.

Contestants are limited to one prize.

A certificate of merit will be awarded to each contestant whose six scorings average 92 or above.

A certificate of merit will be awarded to each contestant sending but five entries whose average score is 93 or above.

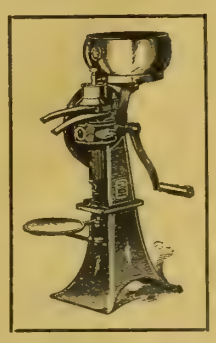
EFFICIENT



SANITARY

MR. DAIRYMAN

We can save you money on a
MILK COOLER.
We not only sell Milk Coolers, but we are also the largest manufacturers of Milk Coolers in the Southwest. Why pay freight from the East and a middleman's profit, when you can patronize home industry and save 40 PER CENT? Our
KELSEY TUBULAR MILK COOLER
is made in all sizes, composed entirely of copper and brass, well tinned and will stand 100 pounds pressure. It will cool the milk within one degree of the temperature of the water and is highly endorsed by boards of health.
We also manufacture the cone and the three pan ice cooler, in all sizes.
Write us for further information and prices.
Guy F. Kelsey Company
106 East Eighth Street Los Angeles, California



Make Your Fall and Winter Dairying Profitable

The wasteful losses of any "gravity" setting system or poor cream separator are always greatest when the milk is often cool or the cows are old in lactation, and under these conditions, with butter prices highest, the use of the best cream separator becomes even more important than at any other season, so that a

DE LAVAL
Will Save Its Cost by Spring

With any setting system you are wasting at least a quarter of your product at this season, with cream and butter values highest, while the superiority of the De Laval to other separators is always greatest under the difficult conditions of separation, particularly in the skimming of cool milk.

Why delay your purchase of a De Laval until another Spring. Put it in now and let it save its own cost meanwhile. And as to that you may either buy for cash on on such liberal terms that the machine will actually pay for itself.

You may prove all this by test to your own satisfaction. See the local De Laval agent or communicate directly with the Company.

Small Fruits and Vegetables

GARLIC.

The garlic industry was introduced into Texas a few years ago by the Italian gardeners of Galveston County, says the Texas Farm and Fireside. Garlic belongs to the onion family and requires similar care in cultivation. It is propagated from "clons" or "sets" exclusively. Clons are parts of bulbets of compound bulbs, and are comparable to the cores of the multiplied onion. They are planted either in the fall or early in the spring. Garlic stands more cold than the onion and can be planted in the fall with safety.

The Italian market gardeners of Galveston County, especially at Dickinson, have demonstrated that it can be grown in commercial quantities with profit.

Garlic always commands a fair price. The present demand in the United States is supplied almost exclusively by Italy and Mexico, as it is grown only to a very limited extent in this country. The Italian gardeners in this state are growing the Italian variety, which is recognized as being superior to the Mexican variety.

Garlic will thrive in a variety of soils, but prefers a rich sandy loam. The Italian market gardeners of South Texas thoroughly prepare their land by deep fall or winter plowing and follow this by harrowing. They then lay the land off in straight rows about eighteen inches apart and plant the sets about every six inches in the rows. Cultivate with hand plow, and hoe in such a manner as to prevent the crusting of the soil. If the soil is not naturally rich in humus and plant food, an application of 1000 pounds of nitrogenous fertilizer per acre will largely increase the yield.

When the tops turn yellow and fall, the garlic is ready to pull. Select a dry time to harvest the crop, braid the tops in long strings and hang up to dry in a well protected shelter. These strings of garlic are generally marketed in sacks holding fifty pounds.

In the fall of 1908, I visited the Italian growers of garlic at Dickinson and secured sets sufficient for a thorough test on my farm at Pauli. The sets were planted in November and the crop harvested in May. My soil is a deep sandy loam, moderately fertile. The garlic made a splendid yield and thoroughly demonstrated its adaptability to the soils of Montgomery county. There are thousands of acres of similar soils in South Texas where garlic has been successfully tested.

RAKING AND BURNING.

I never rake and burn in my garden. In fact, there is nothing to rake in the spring, for the garden is kept at work winter and summer, growing something to eat.

In the fall, after the frost destroys the tops of the summer vegetables all the dead growth is raked and hauled to an out-of-the-way place in a pile with a little lime scattered over it.

During the summer all the refuse from the kitchen is dumped on the same pile and covered with lime to keep the flies off. The pile is chopped down and turned occasionally, and by fall it is a black, rotten mass and goes back on the garden.

The winter sees the garden cleanly cultivated with spinach, kale, parsnips, salsify and carrots standing in rows, and onions from sets coming on for the table in late February.

Then there are some hardy bulbs that I grow for the florist, thousands of candidum lilies, which I have shown to the trade, can be better grown here than in France.

In the spring my early peas and other early vegetables go in between the rows of kale and spinach that will soon be finished; and the parsnips, salsify and carrots and late beets come out before the ground is needed for the later tender things.

The entire garden gets a coat of stable manure, annually in the spring, and to this I add a mixture containing eight per cent of phosphoric acid and 10 per cent of potash at a rate of 1000 pounds an acre.

To get good crops in the garden, we must make and keep the soil rich and well supplied with organic decay. In the intensive work of a garden of moderate size we cannot afford to grow clover and other humus-making crops and must use the stable manure.

Then, so far as insects are concerned, the garden kept clean all the year will not be so much bothered with them. However, I spray all the crops with insecticides and fungicides regularly but I never burn anything that can be rotted down to aid in the humus-making.—Farm World.

SUBSTITUTES FOR ASPARAGUS.

Years ago, when we did not have asparagus in our gardens, we made use of various substitutes. A good one is hop sprouts. They come up from the root crown about as numerously as asparagus sprouts. They are rather slim, but when cooked like asparagus by a good cook they are quite palatable. We have also used a certain kind of lettuce (Lactuca augustana) advertised for such purpose by European seedsmen. The leaf stems of this were cooked like asparagus. It was all right, too, but not equal to the true asparagus. Then we tried Swiss chard, the wide leaf stems and mid ribs of which are also recommended and will do when you have nothing else.

The hop sprouts are available during the asparagus season. The other substitutes, of course, are somewhat later. This search for substitutes, however, shows in itself how valuable and desirable a vegetable we have in asparagus.—Farm and Fireside.

THE GREEN CABBAGE WORM.

Give children a few cents to make nets of mosquito bar and catch the white butterflies flitting over your cabbage and cauliflower fields, since the female moths deposit the eggs from which the cabbage worm comes. Children might well be paid, also, for picking off the green worms before they have done much injury.

Spraying with Paris green is quite commonly practiced, and cabbage will stand a strong application. A market gardener of our acquaintance uses a spray as strong as five pounds of Paris green in a fifty-gallon barrel of water. Cabbage may be sprayed up to within a week or so of being gathered, when necessary, without any damage whatever, or any danger.

PICKING CUCUMBERS.

With many growers it is the custom to pick cucumbers three times a week. In some of the large establishments they arrange the picking so that some fruit is taken off each day and the vines are gone over every other day. It is not best to let the fruit grow too large as they will not sell as well, as a rule, although some buyers prefer large fruits. At any rate the seeds in a very large cucumber are very much harder than in a fruit of medium size and hard seed are objectionable when the cucumbers are to be used as slicers. Furthermore, the development of the seed is very exhaustive to the plant. Therefore, the earlier in the development of the fruit it is gathered the better for the plants.—Market Growers Journal.

According to Bailey, varieties of most of our vegetables and fruits have been cultivated for thousands of years. There were evidently many plant breeders long before Burbank. Lettuce has been known for over two thousand years and originally was found in Europe, Asia and Africa. The cabbage, which comes from Europe, has been grown for over four thousand years. The watermelon has been cultivated for over four thousand years also. Its original home is tropical Africa so the negro "comes honestly" by his liking for this luscious product of our garden.

Root crops should be planted together, as well as vine crops, such as cucumbers, melons, etc., also tomatoes, peppers, egg plant and the like.

Distillate Engine

Mounted on wood skids, complete with 8 x 6 Pulley, Batteries, Spark Coil, Fuel Tank, Lubricators, Muffler, Wire and Switch.

The Patented Galvanized Hopper for cooling is made of one piece of sheet iron, heavily galvanized all over after completion. The circulation is perfect and evaporation slight, making an ideal cooling device.

They are built in two sizes and both rated well below the power they will develop.

The Ornamental Garden

PROPAGATION OF LILIES.

Lilies are propagated by scales and bulblets, and although rather a slow process, requiring three or more years to bring the young bulbs to a flowering size, we have the satisfaction of knowing that they are vastly more enduring than the imported bulbs, and that if correctly treated the majority of species will prove of permanent interest and value. Amongst those that produce bulblets in the axils of the leaves are the old tiger lily, and its altogether more refined and handsome varieties, splendens and flore pleno. L. Canadense and the Bermuda lily are also well known species bearing bulblets, which almost invariably appear upon the whole length of stem. Towards the end of the summer they assume a very dark color, and as soon as they separate very readily from the axils of the leaves they should be collected, and stored in sand until the following spring.

Some species and varieties do not produce bulblets, but we have a ready means of increase by detaching a few of the outer and mature scales, and laying them horizontally upon a mixture of sand, cocoanut fibre and charcoal dust, and then covering them lightly with the same material. In the course of six weeks roots will appear on the basal part, and often on the edges of the scales, and when it is seen that a few have been formed, they should be placed a couple of inches apart in boxes or deep pans filled with a compost consisting of equal parts peat and loam, with a small quantity of leaf-soil and sand added. Their winter quarters will be the greenhouse shelf, and from spring onwards an unheated frame, and this also applies to the first-named. It may be explained that the continental growers obtain huge supplies of bulblets by lacerating the basal part of inferior bulbs. These are partially cut through in various directions, and are then planted in a light and sandy soil. Having experimented in this direction, writes Walter H. Aggett in the Gardeners' Magazine, I can testify that it is simply astonishing to see the behavior and efforts of the bulbs to perpetuate their species, each crevice becoming literally a mass of small bulbs. I commend this practice to amateurs who may wish to propagate lilies, and a single bulb of each species will be sufficient to commence with. In dealing with the bulblets I would advise that they be grown in boxes for a couple of years, as they require far less attention than when placed in small pots, and when they have developed to the size of a billiard ball they should be potted, and it will be found that pots four and a half inches in diameter will be none too large for them.

The more hardy, robust and accommodating species may be planted in the open garden to form permanent colonies; in fact, almost without exception lilies can be successfully grown in this way, and failures that are recorded may invariably be traced to mismanagement, or to imported bulbs having been planted, and it is well known that the most popular lily, namely, L. auratum, is of little use after flowering. Under the most careful treatment only a very small percentage bloom the second year, and it seems a great pity that the bulbs should be mutilated and denuded of every vestige of basal root prior to exportation by the Dutch and Japanese growers.

By far the most successful colonies of lilies will be seen in close proximity to, or between, shrubs, such as rhododendrons, etc., and we gather from this that the shrubs throw just the requisite amount of shade on the surface; also that the masses of thread-like roots emanating from the shrubs effectually prevent saturation in winter, a combination of favorable circumstances which has much to do with the eminently satisfactory results obtained under these conditions. —Gardening.

Poppies will perpetuate themselves by self-sown seed.

ASSISTANT FOREST RANGERS.

The Civil Service Commission will hold an examination for Assistant Forest Ranger on October 23-24, 1911. The United States Department of Agriculture estimates that 400 eligibles will be needed during the field season of 1912. Assistant Forest Rangers are paid an entrance salary of $1,100 per annum. The examination will be held at National Forest Headquarters.

The law requires that, when practicable, forest rangers must be qualified citizens of the state or territory in which the national forest on which they are appointed is situated. Since the list of local eligibles must be exhausted before eligibles residing in other states can be appointed, the chance of citizens of outside states who go to national forest states and take the examination to secure an appointment is small.

The requirements and duties of forest rangers are thus described in "The Use Book," which contains the regulations and instructions for the use of the national forests:

"A ranger of any grade must be thoroughly sound and able bodied, capable of enduring hardships and performing severe labor under trying conditions. He must be able to take care of himself and his horses in regions remote from settlement and supplies. He must be able to build trails and cabins, ride, pack, and deal tactfully with all classes of people. He must know something of land surveying, estimating and scaling timber, logging, land laws, mining, and the live stock business.

"On some forests the ranger must be a specialist in one or more of these lines of work. Thorough familiarity with the region in which he seeks employment, including its geography and its forest and industrial conditions, is usually demanded, although lack of this may be supplied by experience in similar regions.

"The examination of applicants is along the practical lines indicated above, and actual demonstration, by performance, is required. Invalids seeking light out of door employment need not apply. Experience, not book education, is sought, although ability to make simple maps and write intelligent reports upon ordinary forest business is essential.

"Where saddle horses or pack horses are necessary in the performance of their duty, rangers are required to own and maintain them. The Forest Service furnishes no personal or horse equipment.

"Rangers execute the work of the national forests under the direction of supervisors. Their duties include patrol to prevent fires and trespass, estimating, surveying and marking timber, the supervision of cuttings, and similar work. They issue minor permits, build cabins and trails, oversee grazing business, investigate claims, report on applications, and report upon and arrest for violation of forest laws and regulations."

The examination will consist of questions regarding the use of the forest, supplemented by a field test to show the applicant's fitness to do the actual work of a ranger. Education and experience will be rated on the answers to the questions on these subjects in the application form and on the applicant's use of English in the written test. Horses for the tests in riding and packing will be provided by the Forest Service.

The examination is under the control of the Civil Service Commission, and not of the Forest Service. Information in detail regarding it, including the names of the places at which it will be held, will be sent to anyone applying to the United States Civil Service Commission, Washington, D. C.

Mass the different varieties of a single flower and the effect is more pleasing than when made up of a dozen varieties. On the lawn as in the vase, popular taste has been trained to admire the harmony of unity.

BULBS

Send for our catalogue of Bulbs, Pansies and Sweet Peas. Mailed Free.

Tulips are gorgeous flowers. Try Morse's Long Stem Tulips mixed, 30c doz.; (postpaid 35c doz.); $2 per 100

CONTENTS THIS WEEK

ONE OF PAJARO VALLEY'S APPLE ORCHARDS, Cover.

APPLE SHOW AT WATSONVILLE; 361.

CITRUS AND TROPICAL FRUITS.—Hairy Vetch; Oranges in Other Countries; 362, 363.

DECIDUOUS FRUIT CULTURE.—Notes On the Apple Show; 364, 365.

WATSONVILLE POULTRY SHOW; 364.

LIVE STOCK AND DAIRY.—Effectiveness; Butter Scoring Contest; Profitable Feed for Pigs; 366, 367.

SMALL FRUITS AND VEGETABLES.—Garlic; Raking and Burning; Substitutes for Asparagus; Green Cabbage Worms; Picking Cucumbers; 368.

ORNAMENTAL GARDEN.—Propagation of Lilies; Assistant Forest Ranger; 369.

EDITORIAL.—Bigger Walnut Crop; Tons of Cots; Citrus Fair; Watching Tariff Tinkering; Farmers' Institutes; Value of Co-operation; The Apple Show; Award for Best Farm; Redirecting Schools; 370.

AGRICULTURAL NEWS NOTES OF THE PACIFIC COAST.—Northern; Central; Southern; The Coast; 371.

PROFIT IN THE POULTRY YARD.—When to Hatch; Poultry Fattening; Clean Drinking Fountains; 372, 373.

LEGAL.—Enforcing Agreement of Sale; Divorce; Maintenance of Wife; 374.

QUESTIONS AND ANSWERS.—Leg Weakness; Weak Back; Plant Lice on Almonds; Renewing Vineyard; Indian Runners; Breeding to Sire; 375.

VETERINARY.—Eczema; Breeding After Abortion; 377.

HOUSEHOLD.—Take Another Hold; Trouble; Recipes; Tomato Relish; Grooming the Motor Car; Origin of Names; 378, 379.

PRODUCE MARKET.—Los Angeles Market; San Francisco Market; Deciduous Market; Citrus Market; 380, 381.

BIGGER WALNUT CROP

J. B. Neff of Anaheim estimates the walnut crop ten to twelve per cent in excess of last year's. The European crop is large but poor in quality on account of dry weather.

TONS OF 'COTS

An error was made in the news notes of a recent Cultivator when it was stated that Ventura County had produced 22,000 tons of apricots this year. There was one cipher too many. It should have read 2200.

CITRUS FAIR

Butte County boosters, especially those at Oroville, are busy with plans for a citrus exposition to be held at Oroville December 5 to 9. Butte County produces some remarkably fine early fruit, and the citrus fair at that date should enable it to make a great showing.

WATCHING TARIFF TINKERING

A tariff committee of the Walnut Growers Association of Southern California has been appointed in the persons of Messrs. C. Thorpe of Santa Paula, J. A. Osmun of Rivera, and A. J. Stewart of Fullerton, to watch the coming national congress in its work of tariff reduction.

California is producing the principal part of the English walnuts consumed in the United States, but both the eastern and western shores are receiving under the three cent protective tariff many tons of foreign nuts. If the industry can be fostered and placed upon a footing where we can supply sufficient so that there is no need for their coming from the East and the West, much money will be kept in this state. Walnut producers have gone none too soon into this fight. One feature will be the securing of information as to cost of producing nuts in Europe, transportation and other factors. Mr. Hazzard of Whittier will soon leave for Southern Europe to gather such information as he can find.

FARMERS INSTITUTES

Prof. W. T. Clarke, Director of Farmers Institutes in Northern California, informs us of institutes to be conducted in Kingsburg, Fresno County, October 19, 20; Tulare, October 23, 24; Corcoran, 25, 26; Armona, October 30; Lemoore, October 31. Other institutes were held at Napa October 12, 14, and at Selma, October 17, 18. Prof. Clarke writes that he has just returned from a string of institutes in Lassen, Siskiyou, and Shasta Counties. He also says: "These institutes were held at towns well away from the beaten track. For one of these held in Lassen County at Bieber, we had to make a sixty mile stage ride. Altogether to cover the series in question, i. e., Little Shasta; Bieber and Fall River Mills, we traveled by auto stage two hundred and one miles. The interest manifested in this work, however, in these out-of-the-way places, more than justified the labor involved. We have also preparations under way for actual dates for institutes at Clovis, Los Banos, Newman, Reedley, Madera, Turlock and Merced.

"A very hopeful feature of the institute work is the very great interest that is shown by the people in the more practical phases of farm operation that we are able to present to them. We find that in the work that the veterinarian may do, more good is accomplished if he actually has animals to deal with, so we are encouraging the bringing in of sick animals to the institute and are holding regular clinics. This takes well. At some of our institutes we have had very good poultry shows and this has helped our poultry lecturers very greatly in their work. Altogether the season seems to have opened well."

VALUE OF CO-OPERATION

A moment's chat with Mr. G. W. Pierce, almond grower at Davis, Yolo County, brought out the value of co-operative marketing of farm crops. Mr. Pierce is a member of the California Almond Growers Exchange, and he remarked that the success that has been gained by the almond growers through the exchange movement will greatly increase the number of trees planted this season. He informed us that practically every nursery tree in the state had already been sold for next season.

Mr. J. P. Dargitz, manager of the Exchange, writes:

"The market has become stronger each week for the last month, and IXL are all cleaned up now. Very few Ne Plus and Nonpareil are left, and the Drakes and Languedocs are moving out also. We have been able this year to ship nuts just as fast as we could get a carload together at any one point, and in several cases have localed from one point to another in order to make up cars to satisfy the demands for almonds."

This shows that the market has already been practically cleaned of this season's nuts, and this, with absolutely f.o.b. sales, California common points, "without any discount whatever." One change made in the method of selling this year is in giving absolutely net weight. Heretofore the bag has been weighed. Now they sell net weight but charge a uniform price of seventeen cents for each bag.

THE APPLE SHOW

With everyone of the five judges placing awards on the exhibits at Watsonville's big show last week from other states than California, the management felt that justice would be done to every exhibitor and that the judges themselves would have less embarrassment. The presiding judge was Mr. G. E. Rowe of Michigan, and the others, Messrs. Dumas of Washington, Sinsel of Idaho, Stanton and Bateham of Oregon. The carload exhibits were given most thorough examination, not only was the beauty of the surface pack observed, but ten boxes from each car were dumped and every individual apple in the ten boxes carefully inspected.

The sweepstakes car award was anticipated, partly because of its general appearance and partly because the winning firm was the winning firm last year and it was known that their carefulness in packing would give uniformly fine fruit.

The box exhibits were very spotted, that is, some of the most excellent fruit was indifferently packed, while next to it might be a perfect pack of almost perfect fruit. Some districts showed a liking for especially large fruit, but as a rule the boxes had the appearance of the regular commercial pack.

The show should have many lessons for the growers of the Pajaro Valley, as it surely had for many attending from other sections of California. The better pack of finer conditioned fruit was noticeable in comparing the show with that of last year, and we doubt not another year will show still greater advancement. We say another year because the Apple Annual Association will doubtless be continued indefinitely and the Pajaro Valley make this its annual festival.

AWARDS FOR BEST KEPT FARM

The Sacramento Valley Irrigation Company which has extensive holdings in Glenn and Colusa Counties and which has installed an irrigation system covering these lands, is taking a very wise course in inducing better care of the farms now being started under the system. These lands of which the company has now nearly 150,000 acres, were formerly used in grain farming and have called forth no attractive improvements. They are now being subdivided into 20, 40 and 80 acre farms. Many of those who have purchased are eastern people, some having no previous farming experience.

Mr. D. B. Ross, General Manager in charge, informed us that the effort of the company at this time was more along the line of conservation of the enthusiasm of these settlers than any other. To that end it has installed a department of agriculture under the supervision of Mr. W. S. Guilford, and under him are engineers to lay out the irrigation systems for the farms, landscape architects to advise as to disposition of the grounds, and vegetable gardeners to give information along those lines. Besides there are contests yearly between the farmers. The story of this year's contest will be given in next week's Cultivator. It is simply referred to on this page to whet the appetite for something good, because the contest is full of interest, and we believe has in it suggestions for other communities. Of course there are but few sections situated as are these lands, but in this contest may be some ideas of value. Last year one prize was offered, though really two were given. This year eleven were offered, and the story of their winning will be intensely interesting.

REDIRECTING SCHOOLS.

The County Life Commission with delegates from various educational and other bodies of the state gathered at the University Farm at Davis last Saturday and discussed the needs of rural common schools; in fact, the redirecting of the whole school system of the state. There was some little spirit thrown into the meeting by the presentation of a resolution calling for state supervision of all schools. At present each district is a law unto itself except as the State University has a certain oversight of high schools in accrediting students. The resolution called for an appropriation of $250 as a bonus for each high school installing a special teacher of agriculture, this amount to be applied on such teacher's salary, and $150 bonus toward the salary of each additional special teacher installed for a special agricultural course of one year. For a special course covering two or more years a $500 bonus is called for for the first teacher, with $300 for each additional teacher. Another provision called for $10 per school per annum which should go to pay for inspection by a member of the Division of Agricultural Education of the College of Agriculture of the State University.

These resolutions were attacked on two scores. In the first place many felt that the seventh and eighth years of the grammar schools should also receive the bonus as it was shown by statistics that 93 per cent of grammar school pupils do not attend the high school. Another point at issue was the making of appeal for a definite appropriation, as this might prove a bugbear to the state legislature who must be appealed to for the passage of the law. Incidentally, there was some feeling that the naming of the supervisor for the schools should also be left to the state legislature. A compromise was effected by which both plans were partially adopted and were referred to the Country Life Committee for harmonizing.

It is hoped the result of the meeting will pass the resolution stage and accomplish something for bettering the smaller schools of the state. The strongest appeal made in the convention was for giving to the little one-room school so far as possible, equal advantages with the larger schools in the more thickly settled sections.

Agricultural News Notes of the Pacific Coast

Northern California

Glenn County expects to add 5,000 acres of alfalfa to the present planting.

A Gridley, Butte County, farmer has cleared about $90 per acre on cucumbers.

Maywood Colony, Tehama County, has set out 400 acres of eucalyptus trees.

One believer in Modoc County will plant 200 acres to apples the coming season.

The bean crop of the Sacramento Valley is now being loaded on the river steamers.

Some hop growers are so hopeful of the market that they insist the price will yet touch 75 cents.

Sheep shearing has been concluded in Glenn County. The clip has been fully up to the average.

Butte County claims to have produced one-tenth of the state's dried peach crop for this year.

The apple crop of the Paradise district, in Butte County, is of better quality this year than ever before.

Farmers of Little Shasta Valley, Siskiyou County, are interested in the project of developing irrigation water for their lands.

A creamery company has been organized at Fort Jones, Siskiyou County, and incorporated with a capital stock of $25,000.

The hop men of Sonoma County are seriously embarrassed by shortage of baling cloth, many growers being unable to bale at present.

The Board of Education of Petaluma has leased a couple of acres adjoining the school and will instruct pupils in agriculture.

The horticultural commissioner of Yolo County reports that the continued cool weather has made a serious problem for raisin producers.

The Santa Rosa Poultry Association and Egg Exchange has moved into its new warehouse. There are over 200 stockholders in the association.

Delegates from all over the state met last Saturday at the University Farm at Davis to discuss ways and means for improving school instruction of children in the county.

A big deal has been closed in San Francisco whereby 25,000 acres of Yuba and Butte Counties will be placed under irrigation. Two great reservoirs are to be built in Dry Creek to store the water.

The Livermore Valley Poultry Association has been organized, with W. H. Bissell, President, and Eugene P. Sabin, Secretary-Treasurer. One of the projects of the association is a big breeders show in February.

One almond tree on the Bidwell ranch at Chico yielded ninety-five pounds of nuts this season. The orchard in which the tree grows has forty-three acres, which yielded 326,000 pounds of almonds selling at from 12 to 15 cents per pound.

Sebastopol, Sonoma County, has been chosen as the next meeting place of the State Grange. Officers elected for the following year are: Master, E. T. Pettit, of Cupertino; Overseer, W. E. Stewart, of Danville; Lecturer, W. V. Griffiths, of Gardnerville; Steward, Chas. E. Collins, of Dinuba.

Central California

Anthrax has appeared among the cattle at Farmersville, Tulare County.

A raisin stemming plant is to be installed at Turlock, Stanislaus County.

The creamery and cheese factory at Novato, Marin County, was destroyed by fire recently.

Fresno fruit growers are anxiously awaiting action by Dr. Wiley on the sulphured fruit question.

The State Grange Patrons of Husbandry met at Visalia last week for their thirty-ninth annual.

Farmersville, Tulare County, has finished its fruit season, and is busy now with shipping dried fruits.

Raisin drying, already late because of the cold season, has been still further delayed by the recent rains.

The Fresno County Fair, held last week, had the finest exhibit of live stock ever shown in that county.

Greenfield, Monterey County, has found apricots so profitable that extended plantings will be made this year.

The large acreage sown to alfalfa in the Poplar section, near Porterville, this year is showing remarkable growth.

Campbell, Santa Clara County, observed October 16 as "Squirrel Day," when the squirrels were treated to poisoned grain.

A Wasco farmer has determined by several years experiment that he can make more profits from potato raising than fruit growing.

The citrus growers of Tulare County met at Porterville recently and were addressed on soil improvement by Prof. C. B. Lipman.

Citrus growers of the Porterville district are agitating the matter of securing appointment of an inspector of fertilizers for their district.

Tulare County has a large exhibit at the Omaha Land Show. It will later be sent to Chicago for the Land and Irrigation Exposition there in December.

Two clam diggers at Port Watsonville were arrested by the game warden for having in their possession clams less than thirteen inches in circumference.

The squirrel inspector of Tulare County reports "99 per cent of the farmers of this county are trying to comply with the requirements, and 75 per cent have succeeded."

Residents of the Worth district, near Porterville, have organized an independent telephone company, to be known as the Rosedale Rural. A. Chalmers is president.

The fifth annual fair of the Fresno County Association last week was given a record breaking attendance, and a good exhibit was made of the agricultural resources of the county.

Orange growers of the upper Tule district, near Porterville, expect to begin picking next week, and are somewhat worried over the marketing of their crop on account of the railroad strike.

It has been suggested that a joint building be erected at the Panama-Pacific Exposition for exhibits of the counties of Amador, Calaveras, Merced, Mariposa, Stanislaus, San Joaquin, Tuolumne and Contra Costa.

Southern California

Walnut picking is started at Camarillo, Ventura County.

The Imperial County Fair will be held at El Centro November 20-24.

Los Angeles capitalists have purchased olive orchard properties at Hemet.

Paso Robles, San Luis Obispo County, has appointed a city squirrel inspector.

San Bernardino dairymen have raised the price of milk to ten cents a quart.

Six hundred and fifty tents are now being used by orange growers of Orange County.

Date palms at the government experiment station at Mecca are now ripening their fruit.

The Tri-Counties Reforestation Committee held an interesting meeting at Redlands last Thursday.

The new sugar factory at Huntington Beach is just closing a very successful first season's run.

The annual meeting of the Anaheim Fruit Association was held on Wednesday of last week.

Alfalfa seed threshing at Murrietta, Riverside County, shows a seed crop not as heavy as last year, but of fine quality.

The great Irvine Ranch in Orange County has harvested some 14,000 acres of lima beans and 4,000 of blackeyes.

The California Creamery Operators Association will be in session at San Luis Obispo during the last week of November.

Two thousand acres on the Santa Margarita Ranch, near Oceanside, San Diego County, are being prepared for planting sugar beets.

Agents of the Southern Pacific have asked its employes to aid so far as possible in discovering any invasion of the dreaded alfalfa weevil.

Last year, for the first time, citrus fruit was sold at auction in California. This policy will be continued this season. First sales will open in Los Angeles about November 10.

Manager J. M. Waterman of the Lima Bean Growers Association estimates Southern California's crop of limas will be worth some $5,000,000.

The lemon rate decision of the Interstate Commerce Commission having been upset by the Commerce Court, lemon growers are gathering their forces for a renewal of the fight.

The cotton mill at Calexico which was burned a few months ago has been replaced. Machinery is now installed, and the plant is ready to be operated. It can handle twenty to thirty bales of cotton daily.

Hundreds of acres of rich bottom land in the San Luis Rey Valley have recently changed hands, and it is anticipated that development work will soon begin. The hay and grain crop on the land east of the valley has been exceptionally heavy.

A big irrigation project is being started in the Amargosa Valley, in the northeastern part of San Bernardino County. Water has been found to be only about twenty feet below the surface, and it is planned to put in an underground dam and raise the water.

The Coast

Merrill, Oregon, has been promised a beet sugar factory.

Spokane's National Apple Show will be held the last week in November.

Wheat and rye are being seeded on the grain land about Finley, Washington.

Oriend, Washington, has shipped several carloads of hay to British Columbia.

One farmer near Walla Walla, Washington, will plant 10,000 apple trees the coming season.

One Montana ranch near Helena is stocked with 200,000 sheep, and 600 sheep dogs are used in herding them.

The Wallowa County wool growers made sales of more than 25,000 sheep at Joseph, Oregon, within ten days recently.

A number of irrigators near Salem, Oregon, have found they are losing their rights because of illegal form of filing on water.

Apple picking is on in the Hood River district of Oregon, and indications are that the crop will not be sufficient to fill orders.

A hop grower at Sheridan, Oregon, declares that Oregon hops, in order to compete with the California crop, must be picked clean.

Young orchards near Myrtle Point, Oregon, are suffering from depredations of deer, which strip the trees of both foliage and bark.

Heavy rains for the last month have delayed threshing in the section about Sydney, Montana, and slightly injured the quality of the grain.

Eighteen thousand acres of fine land in lower Butte Valley, near Dorris, on Klamath Lake, Oregon, will be reclaimed and irrigated.

Occasional showers with general warm weather have combined to make exceptionally good pasturage in the dairy district about Bay City, Oregon.

An expert of the Department of Agriculture has been gathering apples of the Hood River section to test as to which varieties prove best keepers in cold storage.

The cattle owners of Elko County, Nevada, have been the victims of cattle rustling to such an extent that they have called in the Nevada and Idaho authorities to put a stop to it.

During the last week 100 carloads of apples have been shipped from Wenatchee, Washington. Nearly 1,000 carloads will be pooled by the Wenatchee Fruit Growers Association this fall.

Walla Walla, Washington, one of the four cities in that state which has a city fruit inspector, has made a determined effort this season to exclude from the market all infected fruit.

Prune growers of Clark County, Washington, suffered a loss of $375,000 to crops because of rain. The growers assert that another year they will protect each tree with umbrella-like tents to prevent damage by the rain.

The provinces of Saskatchewan, Manitoba and Alberta will show an area in spring wheat this year of nearly ten million acres. Much of the new acreage will be sown by farmers from the United States who have lately emigrated to Canada.

Profit in the Poultry Yard

Practical poultry people who may have ideas from their experience as to methods of feeding and housing and general care of poultry will confer a favor upon the Cultivator and its circle of readers by sending in concise accounts. Mrs. Basley is always willing to answer queries, which with the experience of others should make this a most valuable feature in poultry life on the Coast. Opinions or matters of a personal nature should be omitted, but a concise statement of facts is always valuable.

WHEN TO HATCH.

By Mrs. A. Basley.

Solomon has said "there is a time for everything under the sun," so there must be a best time for hatching chickens.

"When you are in doubt consult nature." If we consult nature she will undoubtedly say the spring is the proper time, the only time for hatching feathered fowl of all kinds.

Wild birds only lay their eggs in the spring time, and it is only in the spring that nature gives them the proper food for raising the young. Then again other birds like the domestic fowls and pigeons have been for thousands of generations trained to lay eggs the year round and to hatch them when man so desires.

In Egypt, where the hatching for thousands of years has been done in enormous hatcheries, the hens have lost the natural desire and instinct for incubation, yet even there the hatcheries are only used during the spring months, when nature would hatch.

The introduction of incubators into America, however, and American progressiveness have, one might say, changed the course of nature, making it almost a question of convenience or expediency when to hatch chickens.

I have hatched successfully every month in the year in California, so I know it can be done, but it is not always expedient to do so, and for the benefit of beginners I will relate some of my experience.

When first I came to California I was informed by a poultry man that he never used his incubators later than March for there was no use in trying to raise late hatched chickens. Another breeder who was raising about eight hundred chickens per year and hatching only with hens told me that he hatched whenever the hens wanted to set, except during August and September, as he found that chickens hatched during those two months did not mature any quicker, nor lay any sooner than chickens hatched in October, and he did not see the use of having to feed and care for chickens for two months extra, and those two months at the hottest time of the year. He was a very successful breeder, winning at the shows whenever he exhibited. His winning pullets were hatched in April, May and June, his cockerels earlier, usually.

The best brood I ever hatched came out on Thanksgiving day, the last Thursday in November. I found that the eggs as a rule were not as fertile in the fall as in the spring and after some years of experience I refused to sell eggs for hatching in the fall.

I remember one time an eastern breeder who had just arrived, came to me in the fall and wanted to buy several settings of eggs. I told him that I did not care to sell so early in the season, but he argued, "You are running your own incubators why should you refuse me?" I explained to him that I could not guarantee the fertility of the eggs so early and rather than have customers disappointed I made a rule of not selling. I acknowledged that I hatched for myself at that season. He still persisted that nearly all the hens appeared to be through the moult, all were in vigorous health, were being fed the ration for fertility and he would be perfectly satisfied with a forty per cent fertility for he knew the difficulty of getting fertile eggs at that season. I let him have several sittings and he was more than satisfied with the results.

I made a practice of hatching every egg that I could in the fall, commencing towards the end of September or first of October and my reasons for so doing were, first, that it paid.

My object was to get cockerels that would be vigorous breeders at eight-een months of age or in the early spring when they were about that age, while those that were culls would be in good condition either as broilers or fryers in the winter and bring high prices then, as there would be but few then on the market; so I was after cockerels first, and here I made some rather interesting discoveries which year after year were confirmed by a long series of experiments.

I had read (as I sometimes still read) in poultry magazines that the male birds ought to be entirely separated from the female during the summer or at any rate during the moult, or whenever the eggs were not being used for hatching. I read that it was necessary to give the birds a complete rest, in order that they might be in a vigorous condition when they were wanted for breeding. Theoretically this sounded plausible and I tried it, and to my great disappointment I found that the male birds that had been my best breeders did not regain their vigor for months, and some of them never again.

The organs of reproduction had become atrophied or dormant by disuse and it was not until the following spring (nature's own season) that they became active again. Since making sure of this from many experiments, I have never entirely isolated the males that have been mated. I always leave two pullets with each. It really made me feel sorry for the male bird; he would at first fret so for the customary society and even when put with cockerels to police them and prevent them from quarreling he seemed out of place and restless.

To have fertile eggs in the fall we must again consult nature and copy her rations at the time when she has fertile eggs—that is in the spring time.

First—The rations then are tender greens just sprouting and grubs and worms with but little grain, for then the grain is all sprouting. Then again by the spring time the fowls will not be so fat as they were in the fall when nature provided a liberal supply of grains to give the necessary fat to keep them warm in the winter. By the spring time they will have lost that, still they will be vigorous and active. To have fertile eggs in the fall or at any time we must duplicate the conditions of spring time. Give an abundance of tender green with sufficient animal food, and to induce exercise the grain should be fed in deep straw so the hens will have to scratch and work for it.

When I began hatching in the fall my object was to get fall hatched cockerels. It was cockerels I wanted. From past experience I had found that when I mated cockerels to old hens I usually had a large preponderance of cockerels, so I mated two year old hens to cockerels. Sometimes I mated only three hens to a cockerel, sometimes as many as ten. I also tried two-year-old males or even older with the hens in the fall, with the following results and discoveries, which I relate, not as conclusive evidence, for as the old saying is "One swallow does not make a summer," and it would take more than one year's experiments at an agricultural station to prove that what I am relating as my experiences are always and conclusively the same.

First I discovered that I could not absolutely govern the sex; secondly, I found that some males sired more males than females and that it was not the most vigorous males that sired the most males; it was the smaller, younger or less matured birds; thirdly, I discovered, and this experience occurred over and over again, that the first eggs laid by hens after a period of rest, such as the moult, and also the first eggs of pullets, hatched more females than males and also that the darker shelled eggs (mine were White Plymouth Rocks) contained females oftener than males. I found that the first eggs laid after a rest were nearly always darker or else spotted with dark marks, and that when in the fall I was most anxious to get males there were more females than males, as it was just after a period of rest. This was a disappointment to me at

first, but later on I found that among those females hatched in October and November were my very best layers.

I might have known that pullets hatched from hens that were laying in the fall just when eggs cost the most would be likely to lay plentifully at that same time of year, but I did not realize it until the conviction was forced upon me by my own experience. Not all of the pullets were the best layers, but a preponderance of my best layers were hatched in the fall. After I had found that among my own White Plymouth Rocks the cockerels hatched in the fall were my best breeders and that the pullets were remarkably fine layers, I made it a rule to hatch every hatchable egg then. "Like begets like," if you hatch from the hens that are good fall and winter layers you will run a good chance of getting offspring from them that will come up to their mother's achievements, and if you know how to breed and mate them to males of the same good strain you will keep on improving your breed until you have grand layers.

A person can breed for whatever he or she wants—for fine feathers in the show room; for the best of table fowls for market; for prolific layers; for layers of large eggs, of colored eggs, or of white eggs. It is all a matter of selection and a study of the breeding qualities of your fowls. By just making up your mind what to do and how to do it and keeping the one object in view all the time you will succeed, there is no doubt about it.

But to return to our question: "When is the best time for hatching chickens?" Spring time, March, is the best time; but you can hatch also whenever your old hen wants to sit. You must remember, however, to give the chicks as nearly as possible the conditions of spring. The reason that I say spring is the best time is because it is nature's time and the eggs will be more fertile then; the fertility will be stronger and the chicks also. Very much depends upon the way in which the parent birds are cared for and the food they have. To have strong healthy chicks the parents must be vigorous; aim for vigor in your poultry yard first and foremost, and then for whatever you most want.

EXTENSIVE POULTRY FATTENING

A bulletin entitled "Fattening Poultry," describing successful methods of fattening poultry on a large commercial scale, and giving complete data on the feeding of over 100,000 birds, has just been issued by the United States Department of Agriculture. It gives information of operations on an extensive scale, and so far as known is the first publication showing the cost of producing a pound of gain in poultry.

"The successful feeding of poultry depends largely on the ability of the feeder to notice the condition of the chickens on feed," is one of the fundamentals laid down by the bulletin. "The common practice in poultry packing houses is to feed each lot seventeen days or less. Most of the milk fed chickens are fed fourteen days. Practically all of the special feeding in this country involves the use of milk, which produces the 'milk fed chickens' of the market. Milk, while the least expensive, seems to be the most essential constituent of the ration, and when a feeder cannot get milk in some form he generally does not attempt to fatten poultry commercially.

"Crate feeding from troughs is the method employed in this country by most of the large fattening establishments, with six to ten fowls in a crate. Birds fed only for a short time may be forced on highly concentrated feeds, whereas if fed longer they may need a ration containing a greater variety and less concentrated.

"Milk seems to have a very important influence on the digestive process, keeping the fowls in good condition under forced feeding. Beef broth is used to some extent, but it is not as good as milk. At the beginning fowls should be fed lightly for two or three feeds, gradually increasing the amount until they do not clean up all that is given to them. The main object should be to keep their appetites keen and at the same time have them consume as much feed as they can assimilate. By feeding a small amount often they will eat a greater quantity and their appetites will remain keener."

The conclusions reached by the investigation show that general purpose fowls make more economical gains in fattening than the Mediterranean class. The average person will get better results in fattening by feeding three times rather than twice daily. It was found that the average cost of feed and labor per pound of gain for a large lot of poultry was 9.09 cents, and the cost of the feed alone was 7.10 cents. It was also observed that hens made less gain than chickens in crate fattening, and that low grade wheat flour was a more economical feed than oat flour at the present prices of grain.

CLEAN DRINKING FOUNTAINS.

One of the difficult problems for the poultrymen to solve is how to easily provide pure, fresh water for his fowls, says the Southern Farm Advocate. Many patent fountains which are on the market are automatic and keep before the fowls a certain quantity. Under certain conditions these fountains serve an admirable purpose. Under more adverse conditions many of these patent contrivances fail to give satisfaction for the simple reason that it is impossible to keep them clean.

If fowls were fed only whole grain and the weather was always cool, it would be a comparatively easy matter to provide satisfactory automatic drinking fountains, but as soft food forms a considerable portion of the diet for laying hens and fattening fowls, these fountains are necessarily more or less fouled, and in warm weather soon become unfit for use as drinking fountains on account of the tainted water and disagreeable odor.

A simple, wholesome arrangement may be made as follows: Place an ordinary milk pan on a block or shallow box, the top of which shall be four or five inches from the floor. The water or milk to be drunk by the fowl is to be placed in this pan.

Over the pan is placed a board cover supported on pieces of lath about eight inches long, nailed to the cover so that they are about two inches apart, the lower ends resting upon the box which forms the support of the pan.

In order to drink from the pan it will be necessary for the fowls to insert their heads between these strips of lath. The cover over the pan and the strips of lath at the sides prevents the fowl from fouling the water in any manner, except in the act of drinking.

Where drinking pans of this kind are used, it is very easy to cleanse and scald them with hot water as occasion demands.

This arrangement can be carried a little further by placing a pan, or what would be still better, a long, narrow dish, something like a tin bread tray, on a low shelf a few inches from the floor, and hinging the cover to one side of the poultry house so that it can be tipped up in front for the removal of the dish or for filling it with water.

The pullet, in the pink of condition, that has just commenced laying, placed on exhibition in the show room for a few days, stops laying for a month or more, and frequently when shown in the fall shows, moults. The same effects frequently follow changing a bird from one pen to another. Birds accustomed to a certain individual are often frightened by the presence of a stranger or by an unusual garment on a regular attendant. These disturbing influences interfere with and upset egg production. The rule should be, keep the fowls in a quiet and contented condition.

To succeed in poultry keeping a person must be adapted to the business, first of all, by having a natural liking for the fowls themselves. The farmer who cannot tolerate the sight of a hen, and improves every opportunity to shy a stone at her or to dog her from the barn or garden can hardly expect to receive a bountiful supply of eggs for his favors.

Shut the hens out of the nest boxes at night. They will creep in there if they can to roost. It is warmer there and they like it; but what a mess they make of the nest.

WITTE ENGINES

GAS—GASOLINE—DISTILLATE—NAPHTHA

Do the work at one cost of One Cent per horse power hour. Immense saving by our method of "preheating" the fuel. Best by perfectly test repairs cost less than $1 per year at most. Every valve is vertical and will not wear out. Has no slip nozzle. Governor cannot stick. Has cylinder and base are separate. Hammer into frames, cut gears, etc.

GUARANTEED FIVE YEARS

We are experts in engine building; have done nothing else for twenty-six years. Our references thousands of satisfied customers. Our prices are right. All sizes, 2 to 40 H. P. Special inducements to introduce in new localities.

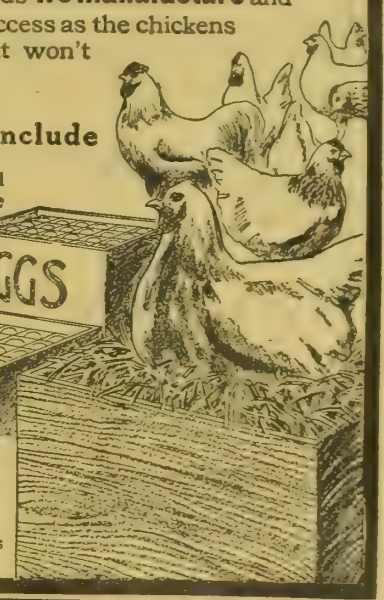
It's the
Laying Hen
That makes Poultry Raising Profitable

There are certain Food Elements that are absolutely necessary to keep your hens healthy and productive. If a hen does not have the proper food and nourishment she cannot be expected to produce eggs

Successful Poultrymen use and recommend our Superior Foods

They find that the Poultry Foods **we manufacture** and sell are as important to their success as the chickens themselves, because a hen that won't lay is a useless expense.



Our Superior Poultry Foods include

Pure Blood Meal — Pure Meat Meal
Beef Blood and Bone — Ground Fresh Bone
Cracklings — Limo Grit
Animal and Willow Charcoal
Granulated Oyster Shells
X-Ray Meat Scraps
Bone Charcoal

Legal

Edw. L. Payne, attorney, 301-304 Douglas Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Payne is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Enforcing Agreement of Sale.

In agreement of sale of real estate in California if the buyer fails to pay installments can the seller get judgment against him, if he has property in another state, and make him pay the installments? Who would have to pay the costs of the judgment? The agreement of sale reads as follows: ". . . and upon failure to comply with the terms of this contract agrees to vacate said premises and peacefully surrender same to said party of the first part. And it is hereby understood and agreed by the parties of the first and second parts hereto, that upon any default in the payment of the sums herein specified, or any of them, or of the interest thereon when due, according to the terms hereof, then this agreement shall be null and void, and any and all sum and sums paid by the party of the second part to the party of the first hereto, shall be forfeited to and retained by said first party as rents, and settled and liquidated damages for the non-fulfillment of the terms and covenants in this agreement made by the said second party hereto."—Reader.

The seller has his option to sue for the installments, or to cancel the contract. If the seller prevails in the action the buyer must pay the costs. The judgment can be enforced in another state by suit upon it there.—E. L. P.

Divorce.

How soon after a wife deserts her husband can he bring suit for divorce? Does divorce on grounds of desertion dispense with the interlocutory decree? When is final decree given? Does it divorce both husband and wife?—Reader, Tulare.

Divorce proceedings may be instituted after one year from date of desertion. Interlocutory decree is not dispensed with. Final decree is granted twelve months after interlocutory. Both are divorced.—E. L. P.

Maintenance of Wife.

A married B twenty years ago in California, A having at the time twelve acres of land and a few months wages due him. He has now accumulated by close living and wise investments, money and property, the money as fast as made by him being put out on small mortgages in his name and bringing in an income of $125 per month, more or less, this being loaned out again, and the family living on what the ranch brings in, any surplus being also loaned. B is hardly able to get any money for clothes and school books for self and children. In case A left B, what could she claim of the mortgages, and how? How can B have things fixed to insure getting her share and also a stated amount per month for maintenance? Two children are over eighteen, and four under. What is legal age for a boy in California?—L. L., San Diego.

The proceeds of the twelve acres of land and other property which he had on hand when he married is the separate property of the husband, and remains such as long as it can be traced from one investment to another. All property earned by either spouse during marriage is community property. If A should desert B, a court in a divorce proceeding granting her a divorce on that ground would have the right to divide the community property between her and him, unless the real estate had been homesteaded, and in that case the court might assign the homestead to B for a limited period, or might order it sold and the proceeds divided, unless it had been selected from the separate property of the husband, and in that case it would have to be assigned to him eventually, although it might be given to her for

(Continued on Page 377.)

Questions and Answers

THE EDITOR AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Leg Weakness.

Some of our half grown chickens seem weak in the knees or legs and one or both legs sprawl out of shape and they stand on the knees. Would like to know the cause and remedy.—Subscriber.

There are two causes for leg weakness in chickens. You remember our rule of three—comfort, exercise, proper food. The two causes are the neglect of the two last "rules." The chickens have been fed a ration with insufficient muscle making elements; and they have not exercised enough to keep their legs strong. If they have a ration too starchy, with not enough green food and animal food, their bones and muscles become weak and flabby and have not the strength to support them. Also if they are not encouraged to scratch by having to scratch for the grain or by not having to run after plenty of grasshoppers, that induces weakness. The little cockerels seem to be more liable to this trouble than the pullets, and I would advise you to eat those weak legged brothers and see that the others have a chance to work and make vigorous fathers. A weak legged cock is no use for heading a pen; he cannot properly fertilize the eggs; so you had better fatten and market those.—Mrs. A. B.

Weak Back.

I have had several cases among my Rhode Island Reds of what appears to be paralysis of the back or legs. Fowls cannot walk.—Subscriber.

It is probably leg weakness and comes from a wrong diet. Give more bone and muscle making food, that is, more protein and less of the starchy elements, and above all encourage scratching.—Mrs. A. B.

Plant Lice on Almonds.

Can you tell me what is the matter with my almond trees? The ends of the twigs or tender shoots on some of them present the appearance of curl leaf, and after a while the leaves dry up and the ends of the shoots die. I thought it must be the red spider, but can find no insect at work on them. I send specimens.—J. B. C., Greenfield.

This query was answered by Prof. H. J. Quayle, of the Southern California Pathological Laboratory. He writes:

"The specimens of almond twigs from Greenfield appear to have been infested with plant lice. This is based upon the fact that several molted skins of such insects were present, as well as a couple of specimens of Syrphus fly larvae, which feed upon plant lice more generally than any other insects. It is of course possible that the curling of the leaves may be due to some other condition of the tree or soil which cannot be diagnosed in a small twig. It is not characteristic red spider injury, although the red spider is probably the most important almond pest in the state."

Renewing Vineyard.

I have just secured a small vineyard of Concord grapes three years old and shamefully neglected. Never have been pruned, are overgrown with grass and weeds, many are dead. How should I proceed to restore it? Can the vacant places be filled by layering. Will cuttings taken last fall but not planted in the spring grow if planted this fall? Is there any rule as to frequency of irrigation?—Reader, San Carlos, Ariz.

Such a vineyard does not offer a very attractive outlook, but if some of the vines are fairly strong and healthy, thorough pruning and putting up the strongest canes on trellises or wires, deep plowing, and replanting spaces, will probably give crop sooner than to start in with new vineyard. We would not proceed by layering, but would use cuttings taken this fall from the vines after they are perfectly dormant. Cuttings taken last fall, if they have formed a good root system, may be reset and will give slightly better results than the unrooted cuttings. No rule can be given for irrigation, for that depends upon your care, the subsoil conditions, age of vineyard, etc. Some soils are never irrigated, others as often as once a month. If the irrigations are sufficiently deep and cultivation thorough, two or three irrigations for the year should be sufficient, though that presumes a heavy winter rainfall. What the rainfall is at San Carlos we do not know, so cannot answer this question.

Indian Runners.

How many Indian Runners is it safe to keep in one yard? Is it better to divide space and put fewer ducks to each yard as with hens, or can you yard a large number together with good results, so long as you are not breeding? They have best of care, a tank of fresh water daily, feed alfalfa meal, corn meal, bran and beef scraps. Have recently noted a few weak legs. What is cause and remedy? They have ample sleeping room, dry and clean, with fine shavings.—R. H. H., Whittier.

This query was answered by Mr. C. E. Pryor of the Long Beach Poultry Ranch, as follows:

"It is not 'safe' to keep over fifty ducks in one yard. The yard for this number should contain 2500 square feet and should be swept clean every two weeks at least. They will lay better if kept in small flocks. The ideal way is to keep ten ducks and a drake in each yard. Divide your yards so that they will be long and narrow in preference to a square shape. This facilitates feeding all from one end and gives the ducks more room to exercise and allows them to go to the far end of the yard when anything in the alleyway frightens them, as they are easily frightened and a fright has a tendency to stop their laying. The best feeding ration is a wet mash composed of 8 parts bran, 4 parts corn meal, 2 parts alfalfa meal, 1 part blood meal or beef scrap. Feed this night and morning, all they will eat up clean. At noon a feed of chopped green stuff or lawn clippings, all they will eat. Leg weakness is caused by faulty feeding or damp quarters as a rule, but sometimes seems to be born in them. They should have grit, shell and charcoal before them all the time, and where this is done there is very little if any leg weakness if the quarters are not damp."

Breeding to Sire.

Would it be all right to breed a heifer to the same male she is from?—Subscriber, Selma.

While the harmful results in this form of breeding are not nearly as great as used to be believed, yet to gain anything by it requires judgment and knowledge. The faults and the perfections are both liable to be increased in the offspring. If both animals have a given fault the inbred offspring will usually show it to degree detrimental to their value. All the new strains are made by cross breeding, and they by breeding brother to sister, or father to daughter, or mother to son. I believe in this case the question rather refers to an accident and I would say if it is a heifer that is dropped raise it but out-breed it strongly in the next sire.—M. E. S.

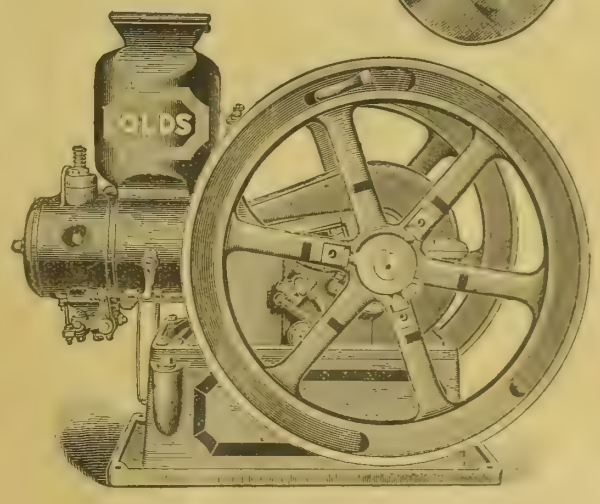
FREE this real leather bill fold for the Head of the Farm

(Not for boys—they're all right and their turn will come later—but this is for the boss.)

Thousands of farmers will buy gasoline engines this Fall and Winter. I want to get in direct and personal touch with every one of them, as I want them to know about the Olds Engine.

If you are going to buy an engine, or are thinking about it, you ought to know what an Olds Engine will do for you. I want to tell you about them—give you just the information you want—so if you will fill out the coupon below (or write me a letter) saying what size engine you want, whether portable or stationary, and when you expect to need one, without asking you to make any promise or obligating you in any way, *I will send you absolutely free* this genuine calfskin bill fold, stamped with your name in gold letters.

It will hold fifteen bills easily. When folded it will go in a small pocket. It is very convenient, handsome and useful; will last a lifetime. Has no advertisement on it.



OLDS GASOLINE ENGINES

are known the world over and used by farmers everywhere. They are the most satisfactory engine made for farm work. I guarantee them to do all we say they will—you to be the judge. Ask any man who has an Olds Engine. He will tell you.

We also make complete electric light and water systems especially for farms.

Write for our prices on corn shellers, corn huskers, feed grinders and cream separators.

If you are going to buy an engine, put a check mark (X) in the place showing the size and style engine you want, and when you expect to need it, and mail to me personally at once. Address me as below.

FARM LANDS FOR SALE.

The Best Bargain Yet—A good, well improved, money making farm of 56 acres, 2½ miles from Arroya Grande, Cal. A prosperous little town—no saloons. Five miles from Pizmo Beach, the finest beach in California. Free rural delivery. The house alone cost $2,000. Good barn and outbuildings. Fine roses. Walnuts and oak trees around house. Assorted berries and fruits. Plenty wood for fuel. Plenty of fine soft water. No irrigation required, consequently no danger of Bermuda grass or other foul weeds. Owner must have the money at once, hence the sacrifice. Price $6,500; $3,000 cash, balance two years, 8 per cent. Also an 80-acre tract of fine, level, loamy land, 50 acres of which is No. 1, in northeastern part of Santa Barbara County. Will grow alfalfa, vegetables, fruits, cotton, etc. No alkali or hardpan. Free timber 1½ miles away. Elevation 2,500 feet. No extremes of heat, cold or storms. Can be irrigated if necessary. $600 takes it. Same owner as above. Wm. T. Mantz, Maricopa, Cal.

For Sale—An apiary of about 100 colonies of finest comb honey producing bees available. Honey crop never fails here, and some of my bees produced 300 pounds of comb honey per colony this season. Alfalfa range or pasture with them sufficient for 300 colonies. Also two acres of fine garden, fruit and berry land, highly improved with modern dwelling, barns, corrals, tank house, shop, chicken park, a young family orchard and variety of berries. Property is on auto stage road, less than one-quarter mile from small town, and 12 miles from county seat. Cash for bees; terms on residence. Address Hayden Gilstrap, Janesville, Cal. Lassen Co.

For Sale—43½ acres 15 miles from Los Angeles, on Covina electric line, located on boulevard, and 1¼ miles south Baldwin Park. Sandy loam, deep soil and level. Twenty acres in alfalfa, balance grain. Six room house, domestic well and windmill. Forty shares of fine water stock and cheap. This is desirable locality, values steadily advancing, great potato country, but walnuts, oranges and alfalfa do fine also. Price $450 acre, half cash, divide in smaller pieces. Joseph Coleman, 412 First National Bank Building, Long Beach, Cal.

Farm Lands—

2,850 acres, fine, rich, level land, adapted to alfalfa, fruits and vegetables; with abundance of pure gravity water; no alkali; no disagreeable surrounding conditions.
Price $11 per acre, half cash, bal. 3 yrs.
In the meantime land can be made to produce many times its purchase price.
Address
Kious-Whann Realty Co.,
235 Mason Building, Los Angeles, Cal.

For Sale—A 20-acre farm for $20 cash and $20 a month; possession now; $90 to $125 per acre; your crops pay for the land; rich, level land for alfalfa, oranges, almonds, grapes, cows, chickens; abundance of ditch water for irrigation for $1 an acre a year. Where else can you get this? In Oakdale Colony, near good town and railroad station. Climate delightful. T. Wiesendanger, 408 West Sixth Street. **Los Angeles,** Cal.

Write me for particulars on one of the best orange, lemon and walnut grove propositions you ever saw. 237 acres. 60 acres planted, full bearing. Where water costs absolutely nothing, from the mountains in Temescal, near Corona, Cal. The water right is worth one-half the cost of the ranch. No frost or scale. $10,000 crop on trees. One six-room house. Two four-room houses, barns, etc. All stock and implements. Price $60,000, one-third cash, balance terms, 6 per cent. Jos. Coleman, Room 412, First National Bank, Long Beach, Cal.

1920 Acres Alfalfa Land—One of the best subdivision or dairy propositions in the Sacramento Valley. 1,000 acres level bottom loam soil, two cow sheds, 400 head capacity, horse barn for 60 head, 10 room ranch house, blacksmith shop, hog sheds, outbuildings, etc. Well fenced and cross fenced, many corrals. Three miles from railroad station in Butte Co. This is an absolute bargain. Price $50,000. Very easy terms. Apply owner, Paul Goodloe, 1049 Phelan Building, San Francisco.

For Sale—San Luis Obispo County, 95.31 acres, lot 16, subdivision of Huasna Valley, 12 miles east of Arroyo Grande; well improved, home ranch; 60 acres bottom, inexhaustible water near surface, balance rolling, scattering oaks; school, P. O., coast climate, hog raising, poultry, dairying; principally; $75 per acre, $2,500 time. For particulars address owner, Chas. F. Wright, Huasna, Cal.

For Sale—San Diego mountain ranch, 160 acres, $2,000 clear; 35 acres cultivated; old house, few bees, fine water, grove, creek, healthy, suitable for stock, alfalfa, fruit or a resort; 20 acres flat valley. Will double in value by 1915. No exchanges. Address E. T. Gray (owner), 605 W. Seventh St., Los Angeles.

Choice Orange Land, Exeter District—63 acres, 3 miles south of the town of Exeter, California, three-quarters of a mile from Southern Pacific railroad station, right in the foothills, leveled, water developed on it. Write for particulars. The Phalanx Company, 513 Chamber of Commerce, Los Angeles, Cal.

For Sale—
THE ORANGE GROVE MAN.
Large list of orange groves in best districts. Seven years' experience in growing oranges.
A. W. RICHARDS,
THE ORANGE GROVE MAN,
Claremont and Pomona, Cal.

For Sale—Five acres, 2 miles south of Monrovia, half set to deciduous fruit; plenty of mountain water, and 6 room house and barn. David Madill, Monrovia, Cal.

For Sale—Five acres in a settled community, cars and school close. Suitable for berries, trees or chickens. Frank Lima, Sebastopol, Cal. Route 3.

For Sale—Near Lancaster, Cal. Bargains in improved and unimproved land. Also relinquishments for sale or trade. Some homestead land. A. S. Burnham, Box 451, Lancaster, Cal.

San Diego County! My splendid weekly newspaper will tell you about this great county and superior climate. 16 weeks for 15c. H. P. Rising, publisher, Escondido, Cal.

FARM LANDS FOR SALE.

Apple Orchards—Large and small, in the only apple producing section in California. The greatest section west of Missouri River. Write for booklet. Geo. W. Sill & Co., Watsonville, Cal.

For Sale or Exchange for Los Angeles or Orange County acreage. Five acres in city of Santa Cruz, all in fruit, well improved. William Richard, 438 River St., Santa Cruz, Cal.

FOR RENT

Imperial Valley Fruit Ranch to Let—160 acres in early table grapes, apricots, alfalfa and cotton; 2 miles from county seat. Tenant must have experience, and $3,000 capital to furnish labor. Address Horticultural Dept., 205 Grant Building, Los Angeles, Cal.

To Let—15 acres, 4 miles south of city limits; good 4 room house, barn, chicken pens, etc.; family orchard; 2 acres in fine table grapes; plenty of water; good soil. See Howendobler, 205 Mercantile Place, Los Angeles.

To Rent—80 acres good beet land, 2½ miles from Garden Grove; 8 room house, large barn, etc. See Howendobler, 205 Mercantile Place, Los Angeles.

For Rent—On shares, 37 acres of fruit and 8 acres of vines. Only man of experience need apply. D. F. Conant, Box 64, Route 5, Modesto, Cal.

Pasture to Rent—3,000 acres. Good stubble and wild feed. See R. Phillips, P. O. Santa Ynez, Cal.

Wild Plant Improvement Gardens, Santa Ana, California. Newton B. Pierce, proprietor. Rare choice ornamentals and new fruits from all lands.

TREES

True to Name

Do you expect to plant any trees this season? Have you determined upon the variety? Have you decided where you are going to buy? Are you satisfied that you are getting the best? Will the trees be "True to Name" and high grade?

These pointed questions every wise fruit grower should ponder well, for a vast amount depends on the start you make.

Settle All Questions

by preparing your want list immediately and mail to us for prices. Send for our book—

"California Horticulture The Fruit Growers Guide"

It describes 2000 different varieties of trees and plants, is fully illustrated. Valuable information to planters. Mailed upon receipt of 25c in stamps.

Veterinary

Answers in this column by Fred G. Matthews, M. S., D. V. M., 1232 Central Ave., Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Eczema.

A mare, eight years old, fed a ration consisting of two quarts of rolled barley and two quarts of bran two or three times a day, has been troubled with an itching skin disease for about two years. Lumps about the size of a pea appeared along the neck and then extended to other parts of the body. She rubs some places raw and uses her teeth upon the skin of the breast. I had her teeth filed and was advised to give sulphur in tablespoon doses, which I did till she had taken four pounds. The lumps disappeared, but have returned.—H. D. W., Fair Oaks.

Mix three parts of neat's foot oil and one part of creolin, shake and apply freely to the itching sruface once every four days. Aiso give the mare one tablesponful of hyposulphite of soda in the feed two or three times a day.—F. G. M.

Breeding After Abortion.

A mare served July 7 aborted Sept. 25 and about an hour later passed the premature afterbirth. I have not worked the mare for six weeks, but she is nursing a colt four months old. There was no evidence of an accident, and I know no cause for the abortion. How soon may I breed the mare?—Subscriber, Corona, Cal.

When all fetal membranes pass, as appears in this instance, and no discharge follows abortion, the mare may be bred on the ninth or eighteenth day according to the custom of breeding after foaling. Examine the food of this mare for molds, smut (ergot) or poisonous weeds.—F. G. M.

MAINTENANCE OF WIFE.

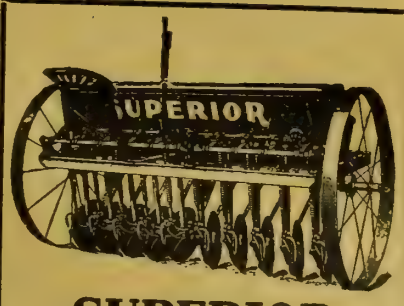
(Continued from Page 374.)

a limited period. If the mortgages are community property the court might divide them equally between the parties. If the husband provides reasonable maintenance, although it be very common and ordinary, I know of no manner in which she can have things fixed so as to insure getting her share, unless by agreement or through divorce proceedings, in case of desertion, or perhaps some other ground for divorce. The placing of a homestead on the real estate might be of some assistance. A boy becomes of age when he is twenty-one.—E. L. P.

Taking off honey is easy and simple with the right equipment, wrich includes inexpensive tools—a bee smoker, bee veil, chisel or knife for a hive tool or pry, and perhaps bee gloves or wristlets.

A thousand colonies of bees are used annually in the cucumber greenhouses of Massachusetts to carry fertilizing pollen. There are 2,100 persons in the state who keep bees.

Never at any time should honey be left open around the apiary, for it always leads to robbing.



SUPERIOR GRAIN DRILLS

MORE MONEY FOR BEETS.

Not content with the increase granted by the sugar manufacturers the growers are still insistent on a $5.50 price for fifteen per cent beets. Los Alamitos and Artesia growers met recently and adopted the following resolutions:

We, the Beet Growers of Artesia and Los Alamitos do hereby petition the central committee of the Beet Growers of Southern California to stand for an increase of at least one dollar per ton in the price of beets, for we feel that since we have a much larger amount of money invested, a much larger expense account and a much greater risk in the planting and growing of beets than do the factories in the production of sugar, that we are entitled to at least one-fourth of the protection afforded by the tariff for the development of the beet industry, and that if we are given such fair consideration we will render all the assistance in our power politically and otherwise so far as we can do so legally, for the development of the industry.

Mr. C. Dougherty of the Association writes:

"The beet industry of Southern California is assuming huge proportions and nearly all of the beets are raised in this valley that lies between Compton and Huntington Beach. Seven factories will draw on this territory next year, the one at Oxnard 3000 tons daily capacity; Chino 1000 tons daily capacity; Alamitos 1000 tons daily capacity; Huntington Beach 800 tons daily capacity; Santa Ana 600 tons daily capacity; Co-operative Factory, Irvine, 600 tons daily capacity; Anaheim, 600 tons daily capacity; total 7600 tons daily.

"These factories represent an investment of $5,000,000 or $6,000,000, and if run at full capacity will grind next year 760,000 tons of beets and make 2,200,000 sacks of sugar worth at present prices $15,000,000. Besides this, thousands of cattle will feed on the pulp and tops, adding considerable to the total of benefit from this great industry.

"To produce these beets the farmers will have over $30,000,000 invested in farms, horses and equipment. The beets here run very high in purity and sugar and the farmers are awakening to their importance in this great industry and organizing for mutual benefit and the development of the industry.'

We doubt not the growers will at least make known the justice of the position they are taking in this matter, and we trust they will be successful.

COTTON PLANTS PARTS.

The United States Department of Agriculture will soon issue Bulletin No. 222, Bureau of Plant Industry, entitled "Arrangement of Parts in the Cotton Plant."

The bulletin describes the plant, its peculiarities, its habits and the various parts. A number of interesting illustrations accompany the bulletin.

"The basis of scientific study of cotton," states the report, "as of agricultural plants, is the recognition and comparison of difference. Whether experiments are being made for the breeding of better varieties or to determine the most favorable conditions or methods of culture, account must first be taken of the differences that are shown in the character or behavior of the plants. Two principal kinds or classes of differences may be recognized in the study of such a plant as cotton. The component parts, such as the points, leaves, flowers or fruits, may differ, or there may be differences in the number or arrangement of parts that are otherwise alike. Changes of behavior that are of serious economic importance may be brought about by changing the number and arrangement of the parts of the plant."

A CHEAP PAINT.

For rough weather-beaten surfaces use 8 gallons crude petroleum or coal oil; 1 gallon linseed oil; 1 pint Japan varnish; 50 lbs. ochre or mineral. This quantity will cover 400 square yards with a durable water-proof coat.

Don't keep bees unless you mean to give them the proper care and attention.

TAKE ANOTHER HOLD.

When your trouble has you nearly down,
And all the world seems one big frown,
Then grit your teeth, though friends may scold;
Breathe hard and catch a better hold.

Once you let up, you're gone, be sure!
Men worth their salt, grin and endure.
Up with your head—defiant, bold!
Reach higher for another hold.

S'pose things are bluer'n indigo;
And you're the only lad used so?
What though nine fail, where one succeeds?
"The tenth am I!" your lesson reads.

Then when you've fought your fight and won,
Don't "get too gay" with Fate—in fun;
But show some drooping soul, less bold
The way to catch a surer hold.

—W. P. Brown.

TROUBLE.

It was evident that the young man was worried. Indeed, it was so evident that Loretta could not well ignore the fact. So, after a few commonplaces, she asked him what was the matter.

"It isn't often that my friends are so evidently thinking of something else when I try my best to be entertaining," she said. "You have something on your mind, and it might be a good idea to tell me about it."

"I don't see how you guessed it," returned the young man. "But the truth is that I am just about as worried as anybody can be. I don't see how the thing can come out right."

"It may not be as bad as it seems," Loretta told him, comfortingly. "Girls overlook a good deal. Besides, a girl who takes the trouble to get angry at you is not often perfectly indifferent."

"You're right again—it is a girl," the young man said, sheepishly. "You see, we live in a neighborhood that is half city and half country, and not quite select enough to be fashionable. It's just as nice as it can be, and we certainly enjoy our garden and our porch to beat the band. My mother almost lives out of doors. Well, there was a house built next door, with a fine chicken yard, and by and by the people moved in."

"It's a way people have of doing," murmured Loretta.

"There was a man and his wife, and after a while a girl came home from college, having been graduated with honors. Gee, she's as smart as a whip! And, honest, it doesn't keep her from being pretty, either."

"I am really surprised," said Loretta.

"Well, somehow we got to be good friends," the young man went on dolefully. "Too good friends for my comfort, it seems. Anyhow, I got interested in her chickens—which are really fine ones, you know, not the common kind at all. I could understand how proud she was of them. She was fond of any kind of pets, and she had a cat that was a dream. It had a long, plumed tail, and had taken a prize at every cat show for several years. She positively worshiped that cat.

"After a while the mother's vegetables came up, and a lot of flowers, for she's a master hand at growing things. Then, just as ill luck would have it, something came and dug up her growing things. It certainly was the limit. Mother got so discouraged that I said I'd kill the creature that did it on sight, whatever it was."

"Reckless!"

"Well, I never thought of the chickens," he proceeded, "till I found Lida Flanders kind of chilly toward me. I asked her, over the fence, one morning, what the trouble was, and she said very pointedly that her most valuable chickens were disappearing at the rate of one a night. I didn't catch the drift of her remarks at first, but when she stepped upon a box and pointed to our lawn I understood. There was the head of her finest rooster! She reminded me that I had declared I would kill whatever it was that dug up our garden, and then she said that she could see I was a man of my word. It seems she had overheard what I said. Well, I didn't know what to say."

"Why didn't you tell her that you didn't know anything about her chickens?"

"Tell her!" repeated the young man. "As if I didn't tell her! If I said it once, I said it a thousand times. But do you think she would believe me, with that chicken's head lying at my feet? Not much! And you wouldn't have, either, not after my silly threat to kill whatever it was that tore up Mother's garden."

"What did you do about it after that?"

"At first I didn't think there was a thing I could do," he sighed. "Lida wouldn't let me come near enough to speak to her. It made me wild to see her smiling at everybody else."

"I wouldn't have given her a second thought, since she was so unjust."

"Oh, yes, you would," the young man assured her. "It would have been all very well to talk like that in the spring, but it was too late for me to quit thinking of her then. Why, I lay awake nights trying to fix it up, and it was not until last week that I had an idea.

"It was the very day she bowed to me as she was going out with young Saunders. You know, he squints or something. Well, bowing to me was more than she had done for so long that I sort of took heart and sharpened my wits. I had been so downhearted that I hadn't really tried before.

"As a result of that inspiration I made the finest trap you ever saw—neat, too, by Jove! It was sort of original, because I had to fit it against the side of the chicken house and make it large enough to squeeze a man's arm as well as kill a rat.

"I had it there two nights before it caught a thing, and then when I went to look at it before going down to the office I found it had worked. There was a cat in it, caught just as securely as you please, and dead as a door nail."

"Oh, how splendid!" Loretta cried. "That surely will please your fair neighbor."

The young man looked at her sorrowfully.

"Do you think so?" he asked. "You see, it was her cat!"—Chicago News.

RECIPES.

Russian Salad.

Take two cupfuls of cold boiled vegetables, peas, small string beans, diced carrots and a little cold boiled potato, and a few cooked Lima beans. Marinate in vinegar for half an hour, drain, dust with salt and pepper, and blend thoroughly with sufficient mayonnaise dressing to cover. Serve on lettuce leaves.

Rolled Oats Cookies.

Three cups rolled oats, one cup sugar, two cups flour. Rub one cup butter into the meal, flour, sugar and one level teaspoonful soda dissolved in 2½ cups warm water. Roll very thin and bake in a quick oven.

Washington Pie.

One egg, three-quarters of a cup of sugar, one tablespoon of butter, one and a quarter cups flour, three-quarters cup of milk, teaspoon cream tartar, one-half teaspoon soda. Bake in Washington pie tins. Filling: One cup milk, sweetened to taste, add one egg well beaten, heat to boiling point, add two teaspoons corn starch dissolved in a little water. After it has boiled up remove from fire. When ready to fill cake, spread, then slice two whole bananas, lay on cream, put a little more cream over them, then lay the cake on top. The bananas may be omitted. The top can be frosted if desired.

Cheese Cake.

Roll out some nice puff paste, not very thin, brush it over with cold

Loading carriers with asphalt at Trinidad Lake

Go to the bottom of the roofing question—if you want to save money on your roof.

Don't be caught by mere looks and mysterious terms. Find out what the roofing is made of.

And the time to find out is before you buy—it is often costly to find out afterward.

Genasco

the Trinidad-Lake-Asphalt Roofing

is made of *natural* asphalt.

The difference between natural asphalt and manufactured or artificial "asphalts" is great. Natural Trinidad Lake asphalt contains natural oils which give it lasting life. They are sealed in Genasco and stay there to defend it permanently against rain, sun, wind, heat, and cold.

Artificial asphalts are residual products. Same way with coal tar. They are mixed with oils which makes them pliable for a while, but the oils evaporate quickly when exposed to sun and air; they leave the roofing lifeless, and it cracks and leaks.

When you get Genasco you can be sure of roofing that lasts. And roofing that lasts is the only kind worth having.

The Kant-leak Kleet is the lasting waterproof fastening for seams—prevents nail-leaks, and does away with unsightly cement.

Ask your dealer for either Genasco mineral or smooth surface roofings with Kant-leak Kleets packed in the roll. Fully guaranteed. Write for the Good Roof Guide Book and samples.

water, spread it half over with grated cheese, then lap the other half over, and pass the rolling pin lightly over it. Cut into strips about four inches long and two wide. Bake in a quick oven.

TOMATO RELISH.

One peck ripe tomatoes. Peel, chop fine, drain over night. Two cups chopped celery, two cups sugar, two sweet peppers, one-third cup salt, one large onion, chopped or put through meat chopper, with the peppers, two ounces white mustard seed, one quart vinegar. No cooking; keep in self-sealers. Sometimes a jar will show a few bubbles. If so, pour into saucepan, put in a little sugar, let it get scalding hot and seal again, and you would never know it had been heated by the taste. The relish is nice on meat or fish, and some eat it on potatoes. The brown bread recipe by Miss Meeder was perfect.—One of your readers, Mentone.

GROOMING THE MOTOR CAR.

Although on all modern cars the lubrication of the motor is entirely automatic, the duty of the operator merely being to supply a sufficient quantity of lubricant, there are always a certain number of grease-cups which should be kept full and given a half-turn every day. These are to be found on the steering gear, the spring bolts, and sometimes on the water pump. It should be remembered that so long as grease is kept in, dust is kept out. From time to time it is advisable to lubricate the leaves of the car springs. It is a point which is generally neglected, yet if attended to twice a year, say at the beginning and at the end of the season, this will wonderfully improve the easy riding qualities of the car. The individual leaves of the springs are finely polished and carefully lubricated before being assembled, but after a certain length of time the oil is forced out, water gets in, allowing rust to form, and instead of the blades rubbing freely on one another they become almost a solid block. In order to apply the lubricant it is necessary to remove the clips holding the leaves together, and remove all weight from the springs by jacking up the chassis. The best position for the jack will depend on the construction of the car, but in all cases it will be found too low unless backed up with blocks of wood, and it should always be placed so that there is no danger of its slipping away. When all the weight has been taken off the springs the leaves will generally open freely, but if they should prove obstinate a little persuasion with the end of a screw-driver will separate them sufficiently to allow grease to be inserted on the blade of a knife. The best lubricant is a good quality of graphite grease.—W. F. Bradley, in Harper's Weekly.

ORIGIN OF CERTAIN NAMES.

Valley Forge; village in Chester County, Pa., so named because it is situated at the mouth of Valley Creek, where a forge was erected by Isaac Potts before the revolution.

Wheeling; city in Ohio County, W. Va., from the Indian, weal-ink, meaning "place of a human head," from the circumstances of the Indians having displayed the head of a white man on a pole at this point. Another authority gives whilink, "at the head of the river."

Yankee; this name with various suffixes forms the name of many places in the United States. The name is a corruption of the Massachusetts Indian pronunciation of the word "English" (Yengeese), and was bestowed upon the inhabitants of New England by the people of Virginia when they refused to aid them in a war with the Cherokees, it meaning to them "cowards." After the battle of Bunker Hill the people of New England, having established a reputation for bravery, accepted the name.—Bulletin 197, United States Geological Survey.

WHAT'S IN A NAME?

"Are you ever troubled with sleeplessness? I am. Some nights I don't sleep three hours."

"I pity you, then. I've got it awfully bad. I've been afflicted now for about two years. The doctor calls it neuris insomnia paralaxitis."

"I've had it about six months; but we call it a baby."

GAS! You Can Have It In Your Country Home GAS!

Or anywhere for cooking, heating, brooders, lemon curers furnaces, or anything requiring heating.

More Efficient Than Wood or Coal

and gives immeasurable comfort and convenience.

How We Solve the Fuel Question

Wood and coal were efficient enough in our forefathers' days when the modern methods were unknown, but with its ashes, dirt, labor and inconvenience it is no longer giving that state of comfort and refinement so much sought after by the modern home, to say nothing of its scarcity and enormous expense. Would you be interested in a proposition whereby you are saved one-half your present fuel bill and given all the conveniences of a city home? Our home-made gas system gives you this. There is no smoke, soot, odor, noise, danger, ashes, dirt, building fires nor carrying fuel. Gives you quick and unlimited heat, pleasure, efficiency, economy, and convenience, and in short improves your home immeasurably.

Absolute Guarantee—Each and every outfit is covered by a positive guarantee.

If you are looking for these advantages, write for further particulars at once. Let us tell you what we can do for you.

THE LAND'S FULL YIELD.

Seed for Alfalfa is a small item in dollars and cents, but the difference in crops is the difference between success and failure, depending upon the selection of seed.

The weevil trouble in certain seed-growing sections is known to all experts, but our buyers have avoided all possible complaint by purchasing a stock of

ARIZONA ALFALFA SEED

This seed is triple cleaned and comes from a hardy, small-stemmed, full-foliaged stand. It is dodder free and altogether as fine a lot of seed as we ever handled. Write for prices.

A FIFTY PER CENT. LARGER TONNAGE of Alfalfa can be grown by inoculating with **"Farmogerm"** at a cost of only $2.00 per acre. No progressive farmer should miss reading our Farmogerm booklet—mailed free.

Hay.

Scott, Magner & Miller say:

Receipts of hay this week have only amounted to 2500 tons; this is an immense decrease from the large amounts that we have been receiving here regularly for some time past. A large part of the arrivals recently have consisted of alfalfa coming by water.

The consumers in San Francisco and Oakland have laid away considerable hay for winter use, and they are now drawing upon these stored lots. There is a little lull in the market which we always expect in the month of October, and this October is no exception to the general rule.

Fancy hay, both of wheat in lightweight bales, and of red oat hay, sell at our top quotations, but very little has been coming in.

The shipping trade has been rather moderate recently both for coastwise demand and also for export to the islands.

Alfalfa has continued to arrive in large lots and the market on this article has remained practically unchanged. If the weather continues good there will be still large shipments coming into the market from the river districts, and it is not thought that any change in the situation would take place if these conditions prevail.

We quote the wholesale prices in round lots on today's market as follows, viz:

Fancy wheat hay	19.00@20.00
No. 1 wheat or wheat & oat	16.50@17.50
No. 2 wheat or wheat & Oat	13.00@14.00
Choice tame	15.00@16.00
Other tame oat	10.00@13.00
Wild oats	10.00@12.50
Stock hay	5.50@6.00
Alfalfa	9.00@11.00
Straw, bale	60@70

Grain.

Wheat	1.47½@1.50
Barley, fancy	1.71¼@1.72½
Barley, good to choice	1.67½@1.70
Barley, poor to fair	1.57½@1.65
Corn	1.60@1.62
Oats, red	1.70@1.75

Oilcake meal	42.00@43.50
Cocoanut cake, ton	24.00@25.00
Mixed feed, ton	25.00@27.00
Shorts	29.00@30.00

Deciduous Fruit Market

F. B. McKevitt, general manager, California Fruit Distributors, reports:

SACRAMENTO, Oct. 14, 1911.—The following gives the number of cars of deciduous fruit shipped from all points in California for the week (seven days) ending Friday morning, October 13, 1911:

Peaches—16½ cars. A few peaches are still offering, but the quantitiy is inconsiderable, and there will probably be no more of them after the following week.

Plums—The movement of this fruit has now entirely ceased and will no longer be quoted.

Pears—50¾ cars. Fall and winter pears continue to go forward in satisfactory volume. The actual movement for the week has been swelled by belated reports of previous shipments which have not come to us until this week. There are not many cars of this fruit now left, probably not more than twenty-five or thirty.

Grapes—518¾ cars. Grape movement continues about stationary and probably will remain at about this figure during the remainder of the season. It is reported that there are not many Tokays left in the Lodi district, but there are plentiful supplies yet to be shipped from the American River and from other sections. 'Cornichons are going forward in increased volume, but there will be no large supplies until after Tokays are exhausted. Emperors have not begun to move yet.

The weather continues fine and is in every way favorable to the proper handling of the crop.

Comparative statement of shipments, October 7, 1911:

	1910	1911
Cherries	250½	216¼
Apricots	289¾	214½
Peaches	2517¾	2004½
Plums	1552½	1364¼
Pears	2345	2216
Grapes	3670½	3608¼
Sundry	14	11
Total	10,640	9634¾

Citrus Fruit Market

LOS ANGELES, Oct. 18, 1911.

Valencias are closing the season most satisfactorily. In every market the prices have advanced slightly or at least a very firm condition prevails. Good stock will readily command from $3.25 to $3.50 and some extra good stock will go as high as $3.75 f. o. b. California points.

The lemon market continues to improve in general tone, $5.00 and $6.00 being readily commanded by fair stock. Practically no foreigns are coming at this time and were it not for California stock fabulous prices would obtain for the few which come.

Shipments.

Shipments of oranges to date since November 1, 1910, 36,586 cars, lemons 6,583, total 43,169. To same date last season: Oranges 25,173 cars, lemons 4,644, total 29,817.

NEW YORK, Oct. 16.—Seven cars Valencias, one lemons sold. Market firm on oranges, higher on lemons. Weather fair and warm.

This year's bean crop at Somis, Ventura County, is heavier than last year's.

SAVING WITH THE SILO.

Noting that the champion car lot of Herefords at the International was fed on ensilage, a North Dakota farmer states that all kinds of stock on the farm will eat it greedily and thrive upon it. He built his silo on a 3-foot foundation made of stone and cement and so constructed that the foundation was cup shaped on the cement surface with a depression two feet deep. This catches the moisture and when mixed with alfalfa leaves or bran makes a fine feed for young stock. He says:

"My silo made it possible for me to sell $700 worth of hay, and the silo was filled from about 15 acres. My stock did as well or better than if I had fed them the hay. If five farmers would each build a silo and together buy an ensilage cutter, they would materially lessen the investment and then, by exchanging work at filling time, they could lessen the expense. But my advice is, build a silo because it has demonstrated beyond a doubt that it is the best and cheapest of feed and will make your dairy or stock business a pleasure, furnishing feed without robbing your soil."

WORMS IN SWINE.

Pneumonia, lung fever and worms in swine are often mistaken for cholera. Wormy hogs are a positive damage and injury to farmers and stock raisers who own them and are trying to make pork raising pay. They are not only hard and expensive to care for when they are troubled by the disgusting parasites in their intestines, but they are very liable to have other diseases which invariably prove fatal. If they have lung fever and worms at the same time, they will hardly recover.—Kansas Farmer.

A GOOD WINNING

At the Fresno County Fair the American Pump won two first prizes—one for centrifugal pumps and the other for deep well pumps. Considering the competition met this is an excellent showing. The judging was absolutely unbiased and the winning was made on merits.

The company has recently issued a new bulletin which may be had free by writing the California Hydraulic Engineering & Supply Co., 70 Fremont street, San Francisco.

Mr. Customer:

We guarantee absolute satisfaction on your part, of any purchase you may make of us. By this we mean that if you are dissatisfied with anything bought from us, for any reason whatever, we agree to refund the purchase price on return of the goods, in addition to paying freight charges both ways.

McSTAY SUPPLY CO.

P. S.—Our guarantee is short and to the point; it could not be made stronger or more binding if it contained a thousand words drawn up by a Philadelphia lawyer. Experience has taught us that most people are honest, and we therefore have no fear of being imposed upon by the absoluteness of our guarantee. All we ask of a customer, should he for any reason be dissatisfied, is that he first get instructions from us as to disposition or return of merchandise.

Freight Rates

REMEMBER THIS

You pay not one cent more for freight than does the largest corporation or dealer for the same amount of goods.

Remember Also—That your freight rate is exactly the same on one, two or three hundred pounds, as that of your local merchant on one, five or ten thousand pounds.

Therefore — Our prices to you saves you the retailer's profit.

What is the Difference between the dealer sending his money to Los Angeles for his goods and putting the profit in his own pocket and you sending your money to McCtay and putting the profit in your own pocket?

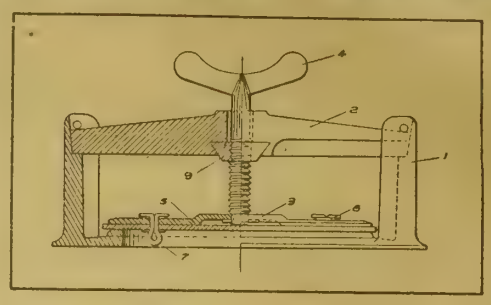
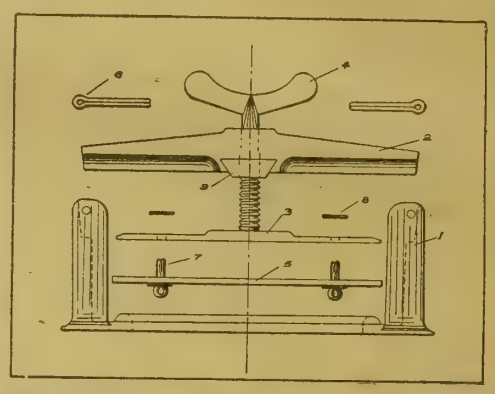
POMONA CIRCULAR VALVE





THE main object of the Pomona Valve is to construct a very cheap and simple valve, and one that requires no special tools or wrenches or experience to operate.

The Pomona Valve is constructed with non-corrosive parts, thus insuring a workable valve regardless of infrequent use. All fastening held in place by cotter pins, thereby making a very cheaply constructed valve and yet a very substantial one.

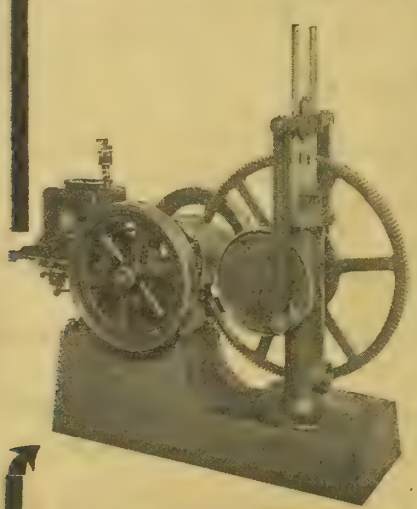
Have You Seen **Gregory's Triumph Engine**



With Direct Connected Pump Jack?

If you have not, you have not seen the latest thing in a perfect little pumping plant. Note the simplicity of this jack; direct lift each side of the piston; no wobbling or jerking, but a smooth, even stroke. Engine is fitted with pulley, so that you can run the washing machine, the churn, the cream separator, and be such a handy little helper about the place.

We have them in 1 and 2 h.p., and don't forget that we carry a very large stock of engines and pumps of all sizes. Come and see us, or send for catalogue.

Pumping Plant

That You Can Depend On?

Then it must be one that is designed expressly to meet your requirements, every part proven by time and service in other plants to be perfectly adapted to do the work it will have to do in yours.

This company is not committed to any one type or system of pumping, but we know the pumps that have given satisfaction and what their working conditions must be, and by means of this knowledge, can take your case, consider all its phases, then outline a plant that we know is bound to absolutely meet your requirements.

Our price will be either f. o. b. Los Angeles, or as we would prefer, installed complete at your well and in perfect running order and doing just what we have told you it would do.

Write us your conditions fully or ask us to send you a card to be filled out. We will quote you a price, a good one, and remember it will cover a plant that you can depend upon.

MAN MUST EAT

There is money in

SUGAR and CATTLE

Share in the profits of an agricultural investment, comprising over 21 square miles of rich agricultural lands.

The land has an abundance of water in a district where irrigation, drought and frosts are unknown. Large tame grass pastures have just been prepared.

The land is free from incumbrances, which affords our investors the highest degree of security.

THE PRODUCTS OF THE RANCH ARE CATTLE AND CANE SUGAR, TWO OF THE WORLD'S BIGGEST DIVIDEND PAYERS, AND ON WHICH THE MARKET IS STEADILY ADVANCING.

In this district lean cattle fatten in four months in tame grass pastures and increase 50% to 100% in value.

Cane sugar is manufactured at one-third the cost of beet sugar.

Additional capital is required for improvements and to buy cattle to stock the ranch. A limited amount of investment certificates will be issued in units of $100 cash or on installments. Six per cent per annum interest is guaranteed, and we also share the profits with you. Option given to withdraw your money and profits or to become a part owner of this great property.

Applications for certificates will be filed in the order received. This enterprise is backed by some of the most substantial and well-known business men of Los Angeles. We invite the strictest investigation.

Send for free booklets and descriptive literature.

C. E. Reed, Secretary

710 Grosse Building **Los Angeles, Cal.**

Conserving Enthusiasm in Sacramento Valley

Methods of Work by a Most Progressive Company. Prizes for the Best Kept Farms. Photos on the Cover Show the Wealth of Soil and Water.

"The West was ages old before the East was discovered! The seer says that if Columbus had come first to the Western Coast New England would today still be an uninhabitable, howling wilderness." This is a statement made by Barbara Worth to a young New York civil engineer who had come to aid in reclaiming the desert along the Colorado river, as described in the story, "The Winning of Barbara Worth," by Howard Bell Wright. It is an excellent novel of California life and conditions—but this is not a review of the book, and the above is only made to call attention to California conditions. The book in question touched upon the great Imperial Valley—although it is there referred to under another name—and the methods of bringing there the people who would make a garden of what had before been a perfect wilderness. But the wonderful results of California sunshine, soil and water, combined with intelligence we believe have justified the truth of the seer's words. Why one should ever emigrate from the Pacific Coast to try and reclaim the barren hillsides of New England today would be hard to understand.

This story of the reclamation of the desert is intensely interesting, especially to Californians who have seen the wonderful results of efforts at reclamation all over the state. Many of these have been vastly different from the reclamation of "La Palma de los Manos de Dios," in that instead of being forbidding desert, rich delta lands and fertile plains have been developed to greater productiveness.

A Great Concern.

This is true of the great plains of the Sacramento Valley; for years that has been the great wheat growing section of the state, but we note in the last reports from the Bureau of the Census a tremendous decrease in wheat production. In the decade between 1899 and 1909 wheat decreased in this state over 2,205,188 acres, or 82.2 per cent. At first look it may appear that this is to the discredit of the state, and in a sense it may be caused by poor farming methods of the wheat producers, but the greater decrease is because the wheat lands are being taken to produce fruits and nuts and the more intensive farmed crops. For example, one particular section of the valley, Colusa and Glenn counties, is being brought under more intensive cultivation by one of the largest financial concerns in the United States, the J. S. and W. S. Kuhn Syndicate of Pittsburg, which has secured great holdings in those two counties covering 125,000 to 150,000 acres. Water is secured from the Sacramento river and conducted in great canals over the land. These lands are now being sold to small holders and many enthusiastic small farmers are today beginning to see the rewards of their pioneering.

There are some places under the system which are seven or eight years old, but these were started before the Kuhn Company or, more properly, the Sacramento Valley Irrigation Company, took charge of the development. This company has been engaged in this work for a matter of three years, though less than two will cover the period of its most active work. It is finding the work somewhat embarrassing because of the "good business" principles which inspired its predecessor who "attempted" to develop these lands. This "good business" is fully illustrated in the book above referred to in describing the cheap and unsatisfactory system which was installed because of lesser cost. The point with the investors in the story was to get greatest returns for least expenditure with the emphasis placed on least expenditure. The present company in charge of these lands follows an entirely different plan; it plans for future as well as present returns. The headings and outlet gates are of reinforced concrete, inverted concrete syphons carry the water under roads, no wooden construction being permitted anywhere.

Sugar Factory at Hamilton, Glenn County.

Conservation.

In a few moments' conversation with Mr. D. B. Ross, the manager, he said that the greatest effort of the company at this time is conservation of enthusiasm of the settlers. The easterner comes to California induced by stories of the wonderful productiveness of the soil, and beautifully colored literature, with the feeling that rich returns are secured with minimum effort. In reality it requires greater effort to secure results than in eastern agriculture, but corresponding greater returns more than compensate. The easterner not understanding this, after the first flush of enthusiasm subsides, becomes discouraged and goes "back home."

One of the steps in this conservation of enthusiasm has been the creating of an agricultural department in charge of one of the best educated agriculturists in this country. This department will give to settlers an outline of the best method of proceeding with the new ranch, lay contour lines, give chart showing grades, advise best plans for laying ditches for irrigation, landscape the grounds about the house, give information as to the vegetable garden, and as to livestock best adapted to the section; in fact, any question the settler may wish to ask will be answered. Mr. W. S. Guilford is in charge of this department. The engineering staff, under E. D. Woodruff of the company, is at his disposal to assist in planning irrigating ditches for each orchard ranch. Mr. Shouse has charge of the gardening department, one of the newer features of the service. The settlers show their appreciation of this service by making fullest use of it. The gardening department, both vegetable and landscape, has as yet been little called upon. Another season will, however, show its usefulness, to a greater extent.

Best Farm.

Another factor in enthusiasm conservation installed by the company is the offering of a series of prizes for the best planned and the best kept farms. This feature was first taken up last year with the offer of a pure-bred Holstein cow, but the company went one better than its promise and in addition awarded to the owner of the second best ranch which showed most careful preparation for irrigation, a fine Holstein heifer.

The interest in this contest inspired others to greater effort for this year's winnings. Instead of being content with offering one prize, the company offered eleven in a series of five contests. The first of these was for the best general farm, three prizes being offered; first, registered Holstein-Friesian cow; second, three registered hogs; third, 25 pure-bred chickens. The next class was best farm in first year's development: first prize in this was a Jersey heifer; second, pair of registered pigs. The next class was best first year orchard; first prize winner getting nursery stock to the value of $25, second taking a $15 bunch of stock. The best first year stand of alfalfa of five acres or more was the next class, mower and rake constituting the prizes. The best preparatory work for alfalfa, five acres or more, won 100 pounds of seed, second best, a two-horse Fresno scraper.

To judge who were the winners of the thirty contestants, Prof. E. J. Wickson of the State University and the writer were chosen and accompanying the judges were two auto loads of people interested in this particular phase of the work which is peculiar to this valley and company. In the machines were Mr. D. B. Ross, general manager of the irrigation company; W. S. Guilford, agriculturist; Mr. R. E. Shouse, landscape architect; Mr. Griswold, photographer and publicity man, and Mr. D. B. Macoun, assistant superin-

Citrus and Tropical Fruits

BENEFIT AMERICAN PRODUCERS.

By Special Contributor.

The farmer and fruitgrower is likely to feel that he is too often discriminated against by the railroads, by the tariff, by the commission men, by almost every one with whom he comes into contact. He has so long been pictured as a "rube" who readily buys green goods and gold bricks that he is tempted to think, at times, that even Uncle Sam looks on him in that light. For years the farmers have been asking for the same measure of protection in the tariff that has been accorded freely to the laboring man and the manufacturer. Has he got it? Not always. Occasionally the man who tills the soil has got something but it has been hard won, and no sooner did he get it than powerful forces were arrayed to snatch it away from him.

Take a concrete case. In Florida and California the climate was found to be suitable for growing oranges and lemons. Enterprising pioneers in both states took up the new lines with enthusiasm. They met with many discouragements and setbacks. There were insect pests, frosts, droughts, scarcity and high cost of labor, unknown problems to solve, years to wait for returns, and competition from foreign lands when other problems had all been reduced and success achieved. Orange growing reached a stage where the home growers controlled the market, and competition was little feared. Lemon growing continued to be a hard fight although the problem of producing a better lemon than the imported had been solved and 50 per cent of the home market was supplied by home-grown lemons. The extension of the market was checked because the importers, with cheap home labor and cheap ocean freights, could, and did, keep the American fruit from reaching the seaboard whenever they wished to do so. Congress wanted to give the American growers an even break, and added one-half cent per pound to the tariff on lemons, or about one and one-third cents a dozen, one-eighth of a cent on each lemon. During the hottest portion of the summer lemons sold in Washington at 10 and 20 cents a dozen. No one found any complaint with this except the Italian importers in New York City. They started in at once to raise a slush fund to fight the tariff. The growers in Sicily and Italy agreed to pay from 5 to 10 cents on each box of lemons imported into the United States to help fight the tariff. They began a campaign to arouse the American public to a belief that it was being wronged, and to influence Congress to remove the tariff on lemons. Congressmen were appealed to by the agents of the importers, the pushcart men and the retail fruit dealers. Untruthful petitions were circulated, so untruthful that their mendacity was evident at a glance. One form of petition refers to the "burdensome duty on lemons," alleged to be "for the purpose of doubling the wealth of ten or dozen millionaires of California, and also for the purpose of paying the wages of tens of thousands of Japanese soldiers who exclusively monopolize the labor of the California lemon orchards, thus depriving American laborers of opportunity of labor and wages." This is very absurd, as well as false. To patronize the foreign lemon growers and steamship companies would be better, the importers think, than to patronize American railroads, American orchardists and American labor. Japanese are employed to a very small extent in the region where lemons grow. If there were enough white labor they would not be employed at all. Moreover, oranges and lemons are now grown in Arizona, Texas, Florida, Alabama, Mississippi and Georgia.

In One of the Shops of San Luis Obispo Polytechnic School.

Such petitions as those just referred to have been circulated at Atlantic coast summer resorts by "barkers," such as those who attract attention to the shows at seaside amusement parks, and many small boys signed them. Posters have also been displayed by these Sicilian agents charging the "high cost of living" on the lemon tariff, which would not cost the average person one cent in a year, if anything at all, for lemons have actually been cheaper this year than they were before the duty was increased, so that the dealers (who are really at the mercy of the importers), are promising a great deal if they promise to reduce the cost of lemons in case the present tariff is repealed.

The fact is that the duty was not a serious burden to the importers until very recently because the execution of the customs regulations permitted them to claim, and to obtain a rebate for alleged rotten fruit, amounting sometimes to fifty per cent of the cargo, which they were clever enough to sell afterwards as first-class

sound fruit. This has been stopped. A close observer in Washington said recently:

"What the government has lost in customs frauds will never be known, but as Collector Wm. Loeb, Jr., has shown at New York alone, the sum must reach many millions of dollars. Importers have shown the greatest cunning as well as unscrupulousness. They have had to refund millions of dollars to the treasury department. Some of the Italian importers were sent to jail. The Italian lemon importers are the latest to have been circumvented, but the government had to revise the regulations for the importation of lemons in order to head them off, and it took eight months to find out how to meet the case. Aided by an almost unlimited 'slush fund' put up by the Sicilian lemon growers, and by very shrewd and resourceful lawyers who are spending money lavishly to buy magazine and newspaper space, the Italian importers are now seeking to have the tariff revised in their interest. This is not the first time foreign interests have tried to shape legislation in Congress, but it is one of the boldest."

The way the treasury department stopped the importers from obtaining too big an allowance for decayed fruit was to make the estimates for rot on the samples displayed for sale. Almost any disinterested person would say that this was fair, but the importers protested wildly and vehemently. The treasury department, however, thought mere noise no argument, and the amount of money collected has increased.

The fact is, the tiller of the soil, although he thought it a bad thing for him that the reciprocity treaty should go through, has got to be considered when it comes to fixing up a list of producers who must have a fair share of protection. Legislation by Congress should be for the benefit of the people Congress represents, and not for the benefit of Sicily, Japan, Mexico, Spain, or any other country.

One reason why many men, after retiring from business undertake orange and lemon culture is the romantic interest attaching to it in a land where winter is unknown. But they need some profit to keep them interested in the work.

DOCTORING PLANTS AND CROPS.

A plant doctor? Yes, such a thing is coming, if not already at hand. It will not be very long now before, if your plants are unhealthy, or your crops droop, or your vines or trees do not thrive, you can call upon the plant doctor to call and examine them, and see what is the matter with them, and prescribe for their difficulty, if they are found to be ailing.

He will not exactly feel of the pulse and look at the tongue of your wheat field, for example, but will critically examine the grain, root and stem, and take a "culture" by clipping off a head or two for further inspection; and when he has decided what the disease is which is causing the trouble, will suggest the cure to be administered.

For a great many generations we have had a science of treatment of diseases of animals. Let anything go wrong with any of his stock, and the farmer well knows that he has the services of the veterinarian to turn to, skilled and practical and efficient. Assistance is at hand from this source at all times.

But, strange as it may seem, up to within a few years, at any rate, little or no thought has been given to the diseases of plants and how to cure them. The value of our plant products far exceeds that of our live stock yearly, and yet no precaution seems ever to have been taken to protect them from the ravages of disease. Why this should have been so for so many years is quite beyond explanation.

In 1883 grape diseases prevailed in the vineyards to such an extent throughout France that much thought was given to their prevention, which led to the discovery of Bordeaux mixture by Millardet, who demonstrated after many tests that copper mixture had a bright future for controlling fungous affections among plants. But little did he realize at the time the real importance and significance of his discovery, for with it came also a new era in plant pathology. Millardet's success awoke scientists at last to a full realization of the fact that plant diseases could be controlled and cured, as well as those of man and domestic animals.

What a field there is here in which science may lend its aid to the benefit of mankind! Many remedies and precautions it can suggest to the agriculturist to apply in similar cases, besides supplying the specialist to come to his aid when the difficulty is too intricate for hm.

Plant pathology will some day be a subject upon which the farmer will inform himself just as he does nowadays upon the chemical properties of soils and fertilizers and the principles of crop rotation. The day is not far distant, at that.—American Cultivator.

FLORIDA'S CROP.

Florida's next orange crop is much lighter than last year. Shipments began on October 1, while grapefruit shipments are ten days later. The Packer says:

"There has been quite a difference of opinion as to the size of the coming crop, some holding it will not be as much, some that it will equal it, while others are optimistic enough to hold that it will be a half million boxes larger. As the shipping season draws nearer and more definite conclusions can be formed, those who have been predicting a 5,000,000 box crop are beginning to lower their estimates.

"Figures for the past five years regarding the citrus fruit shipments are interesting, showing a substantial increase up to the past year, when an appreciable drop from the previous years is indicated. These figures, which come from a thoroughly reliable source, follow: 1906-07, 3,500,000 boxes; 1907-08, 4,000,000; 1908-09, 4,800,000; 1909-10, 6,178,000; 1910-11, 4,614,496."

Lack of rain is the cause of light crop, also of a large proportion of russets.

HIS IDEA OF A CYNIC.

Jack: "Gayboy and the girl he is engaged to are both cynics."

Tom: "What is your idea of a cynic, anyhow?"

Jack: "A cynic is a man who has had experience, or a woman who hasn't."

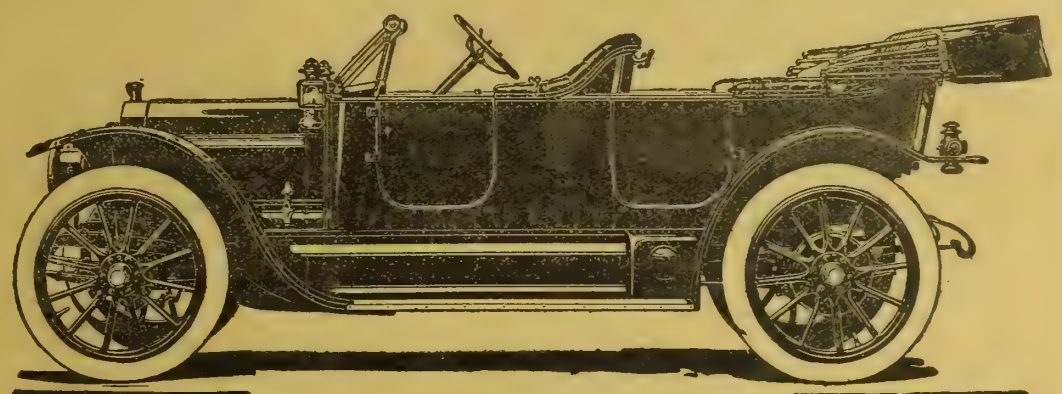
EFFECTS OF TRAVEL.

"Yes, sir," remarked the globe trotter, "if there is anything in a man, travel will bring it out."

"Yes," especially ocean travel," rejoined the man who had just returned from his first trip across the pond.

Rambler

1912—Cross Country—$1650



IT'S 38 horse-power, five-passenger, with 120-inch wheel base and 36x4-inch wheels and tires. *It's long, it's low, it's roomy.* Low, with drop frame—long, with front axle set forward and straight line torpedo body. Roomy, with 27 inches from front seat to dash and 30 inches from seat to seat in tonneau. No outside door latches. Enclosed ventilated front and hooded dash. A car of exceeding beauty, finished in English Purple Lake—it's a rare shade of deep maroon—trimmed in nickel. Radiator to conform to body lines, high and distinctive in appearance. Fenders with sweeping grace. Powerful brakes. To drive this car is exhilarating. It runs like a spirited horse. You touch the throttle and it's away. It's the Rambler Cross Country and the flag-bearer for 1912.

Equipment, Bosch magneto. Fine, large, black and nickel headlights with Prest-o-lite tank. Black and nickel side and tail oil lamps; large tool box; tool roll with complete tool outfit. Roomy, folding robe rail; foot rest, jack, pump and tire kit. Top, with envelope, $80—wind shield $35. Demountable Wheel, less tire, with brackets and tools, $30. Eveready Automatic Engine Starter $175.

COMPLETE LIST OF WINNINGS AT WATSONVILLE APPLE SHOW.

Feature Exhibits.

First, $200 — Watsonville High School's Panama Canal; score, 975.

Second, $125 — San Monte Fruit Company's globe; score, 885.

Third, $100—Santa Cruz Chamber of Commerce's Casino; score, 850.

Fourth, $75—Employes of California Spray-Chemical Company's "Spraying in 1923"; score, 810.

Fifth, $50—Y. M. C. A.; score, 780.

Sixth, $25—Monterey Chamber of Commerce's customs house; score, 760.

Seventh—Stewart Company's hemisphere; score, 740.

Eighth—Flath's growing Bellefleur tree; score, 700.

Carload Exhibits.

Sweepstakes won by Alaga Brothers with car of Red Pearmains.

Best car of Newtown Pippins, Gospodnetch & Zegar, Lakeside brand; score 774. Prizes—Official gold medal, $100 cash by National Ice and Cold Storage Company of San Francisco, silver trophy by W. Dennis & Sons of New York and Liverpool, 100 pounds arsenate of lead by California Spray-Chemical Company.

Second best car of Newtown Pippins, Earl Fruit Company; score, 750. Prizes—Official silver medal and $50 cash.

Best car of Bellefleurs, L. S. Bradley Company; score, 884. Prizes—Official gold medal and $100 cash, can Black Leaf "40," by California Spray-Chemical Company.

Second best car Bellefleurs, B. Pista & Bros.; score, 849. Prizes—Official silver medal and $50 cash.

Best car of mixed varieties, Loma Fruit Company, Green Cleat brand; score, 666. Prizes—$200 cash by Hihn-Hammond Lumber Company, silver trophy by Watsonville Register Publishing Company, 100 pounds Sherwin-Williams arsenate of lead by Charles Ford Company, $45 nailing press by A. Willows of Redlands, official gold medal by the association.

The other scores were: M. N. Lettunich & Co., Newtown Pippins, 746; Lettunich Bros., Newtown Pippins, 731; United Fruit Growers, Newtown Pippins, 681; Macdonald & Sons, Bellefleurs, 540.

100 Box Lots.

Sweepstakes—M. L. Kalish & Co., score 915.

Bellefleurs—Winner, M. L. Kalich & Co., score 915; second, Stephen Scurich, score 884.

Mixed varieties—Winner, Nick Banaz, Templeton, score 864; second, A. Balich Fruit Company, score 849.

Newtowns—Winner, Frank Radovan, score 880; second, H. T. Davis, Corralitos, score 875.

50 Box Lots.

Sweepstakes—Frank Radovan, Red Pearmains, score 916.

Red Pearmains—Winner, Frank Radovan, score 916; second, Ewell Fruit Company, Santa Cruz, score 825.

Newtowns—Winner, Milanovich & Pista, Hollister, score 801; second, Copriviza & Gera, score 648.

Bellefleurs—Winner, Gospodnetich & Zegar, score 993; second, Stephen Scurich, score 795.

Mixed varieties—Winner, Martin Bros., score 816.

Langfords—Winner, Goke & Way Company, score 636.

25 Box Lots.

Newtowns—Milladin & Moncovich, first, score 971; J. P. Braycovich Company, second, score 944½.

Red Pearmains—Monterey County Chamber of Commerce, first, score 938; Zar Bros., second, score 934.

Bellefleurs — Kingsley Company, Aromas, first, score 870; Stephen Scurich, second, score 867.

Jonathans—Loma Fruit Company, first, score 946.

White Winter Pearmains—F. P. Mannovich, first, score 962.

Spitzenbergs—Novacovich & Stolich, first, score 915.5.

Mixed—W. Sasaki, first, score 864.

Single Box Lots.

Miscellaneous Awards.

First prize, best ten 25 lb. boxes of dried apples, Unglish Bros.; second, T. J. Hunsaker, Santa Cruz. First, forty 50 lb. boxes dried apples, Unglish Bros.; second, Quong Sang Lung. First, forty 25 lb. boxes dried apples, Unglish Bros.; second, Kingley Company, Aromas. First, bottled cider, S. Martinelli. First, bottled vinegar, Jones Bros.; second, Ewell Fruit Company, Santa Cruz First, barrel vinegar, Jones Bros.; second, Ewell Fruit Company. First, factory jelly, Ewell Fruit Company. First, canned apples, Mrs. C. G. Redman. First, apple catsup, Miss Rose Marshall. First, apple jelly, Mrs. M. A. Resh; second, Mrs. F. H. Nohrden.

HONORING PROF. COOK.

One of the live wires in horticultural matters for years has been the Claremont Horticultural Club, organized largely through the efforts of Prof. A. J. Cook. Prof. Cook has been its president since founding, and has been the greatest factor in its success. At its regular meeting last Monday new officers were elected, and on account of Prof. Cook's removal to Sacramento to take up the work of State Horticultural Commissioner, he retired from the office of president. Fortunately a most excellent presiding officer and

booster has been elected in Mr. B. L. Olds.

Regarding Prof. Cook's leaving and the greater responsibilities he is taking up, the following was read by one of his associates in college work and adopted as the unanimous sentiment of the club:

"The announcement that Prof. Cook has been appointed the State Commissioner of Horticulture involves a good many matters of most serious import. Pomona College is losing a man acknowledged by many very competent to judge as one of the greatest teachers and college professors in this country. Southern California is losing one of her most active and useful citizens. The whole state is gaining for the first time in her history a professional man in an office which absolutely requires a man of the broadest and best training.

"The loss to Pomona College will be felt most keenly by all of the students who have known Prof. Cook personally. His genial nature, his great heart, his tremendous and infectious enthusiasm, his keen interest in the

personal welfare of every student under him—these things have made him greatly beloved to all. His interest in his students has never, through all the years, been a perfunctory one, but always a living, active interest that went right out and fought for them, an interest that not only helped them to find their life work and get into it, whatever it might be, but ever after supported and encouraged them to great efforts. In a quiet way, unknown to the public, he has even financially assisted deserving students to complete their work, and for this he has been repaid in some things beyond the value of money—loyalty and love.

"The efforts of Prof. Cook to place his department in the college upon the most efficient working basis have been unexampled, involving the most strenuous endeavors, and leading even to severe personal sacrifices. The public has known little of all this, so that the fight has to a great extent been a lone one for Prof. Cook. Without just such a man through those days of struggle in the building of the college the Department of Biology would never have amounted to anything. All that it has accomplished is simply a measure of this man.

"Prof. Cook's services to the general public are warmly acknowledged by grateful men and women throughout the length and breadth of the state. His correspondence on horticultural and agricultural matters has for many years been of very extensive proportions—and religiously attended to with love and interest, and on his own time and expense. He has been for years the main mover in the Claremont Pomological Club, a large organization of great strength and usefulness. For all of these great services he has had no public acknowledgment, because the extent of his work has been known in the aggregate to but few. His reward has been found in the high regard of great numbers of our best people.

"Now comes this appointment to the State Commissionership of Horticulture—which is, as Governor Johnson well says, one of the most important offices in the state—as the crowning event of Prof. Cook's remarkable career, and it is an appointment that will be a lasting monument to the critical discernment and good judgment of Governor Johnson. No man in the state or in the country at large could bring to that office greater clean-cut and indubitable fitness than Prof. Cook. No man would be able so surely to gather about him a staff of the best working material in the whole country, for no man knows our American workers better, and no man is more favorably known to them in the light of a chief under whom they might 'jump in and do things,' without any of the petty and repressive supervision that spoils so much good material in our public offices. Prof. Cook is large hearted, sympathetic, kindly, and broad enough and big enough to make a good executive. The office is not only a great one in the state, but the greatest of its sort in the whole United States. No other office of the kind involves such great possibilities. It carries a large corps of well paid assistants and princely support. For the first time in the history of the state a man is now entering the office who knows thoroughly well the means by which these great possibilities may be practically developed to their greatest efficiency.

"Congratulations are due Prof. Cook, Governor Johnson, and the State of California. Lastly, let us think of ourselves for a moment, and the great honor to Pomona in furnishing such a man."

NOTES.

Never forget that it pays to grade the fruit.

If the hot fruit is placed in cold storage it immediately sweats, to the detriment of the easy wiping and packing. Don't forget that the least abrasion or cut in the skin gives the mold a foothold; and, once started, the decay will continue under the most favorable transportation conditions.

Work up the surplus apples into cider and if there are grapes to spare, try the unfermented grape juice.

Clipper Lawn Mower Co
Dixon, Illinois

Thin carrots, beets, etc., if they are thick. The extra plants become weeds in effect, if allowed to grow.

Small Fruits and Vegetables

KOHLRABI.

I am not an admirer of turnip flavor, though many persons are. There is not much objection to kohlrabi, however. It is milder in flavor than turnip, it is tenderer while young, it comes earlier, and it is very easily grown.

My advice is to sow a little row of it, for you have plenty of time yet to do it. Thin it to stand a few inches apart in the row; no need of transplanting it. In preparing kohlrabi for the table, use the globe shaped enlargement above the root, the base of the leaf stalks. This is peeled and cooked like turnips or cauliflower. A good cook can make it very palatable. White Vienna is the variety mostly used and most suitable for these purposes.—Farm and Fireside.

LIMING SOIL.

We would not spread lime on potatoes after they are up and it is very doubtful whether we would apply it to ground where potatoes are to be planted. On soils that are alkaline in reaction, the potato scab is more likely to develop than in soils tending to be sour. Moreover, we would not add lime to any soil; we prefer ground limestone or marl. These substances do not destroy the organic matter in the soil, while lime, whether it be in the form of calcium oxide or calcium hydrate, does destroy more or less of the organic material. When nitrate of soda is used as a fertilizer, it is customary to apply from 200 to 300 pounds to the acre for potatoes, corn, oats and grass.

Never plant melons near squashes or pumpkins.

FORMALIN FOR SEED POTATOES.

Take a pound of formalin to thirty gallons of water. Place the potatoes whole in a sack, suspend them in this solution for two hours, spread them out to dry; then cut and plant. The conclusion is that the treatment of seed potatoes not only tends to keep them relatively free from scab and other defects, but gives a better stand, and the total yield is in this way increased.

SWISS CHARD.

Swiss chard, or the leaf beet, is another vegetable that should be oftener grown. The seed may be sown at the same time as the ordinary beet crop; the leaves thinned as they crowd; and later part of the leaves may be taken off the plants and cooked; the plant replacing those taken with others. Swiss chard is relished during the summer and autumn, when spinach is scarce. It is also a profitable plant to grow for poultry.

Drilling in the Seed.

CABBAGE.

Cabbage is a biennial, a native of Western Asia. There are three principal groups—the red-leaved cabbage, used principally for pickling and salads; the smooth-leaved cabbage, which is the ordinary garden type; and the wrinkled-leaved or Savoy.

Working in Onion Sets With Planet Jr.

It is a well known fact that size counts for more than anything else in getting fancy prices. An apple of medium size often brings more money than a large one, but when it comes to the strawberry, consumers want berries of extra size. Color and quality are also important, but size is of first importance in the effort to secure the best prices.

REIERSON MACHINERY CO., MANFRS., PORTLAND, OREGON

The Ornamental Garden

GOSSIP FOR THE FLOWER LOVER.

Answering query as to how to make the crab cactus bloom, the Farm World says:

If this is identical with, or closely allied to the humming-bird cactus, a rich soil composed of loam, with a little sand. is good for the plant.

See that the drainage is good. During the warm weather, treat it like the geraniums, watering almost as much and feeding it once a month with liquid manure, or other plant food. The buds should form in the autumn and from Thanksgiving to Christmas the normal plant is covered with blossoms.

Let it rest during the winter, watering it just sufficient to keep it from drying.

Sometimes, especially after profuse blooming, the branches shrivel and drop off. This may be due to overblooming, but it is more frequently traced to imperfect drainage. In the latter case, the better plan is to repot.

There are myths and notions prevalent regarding many plants, among them being one that the knife-blade cactus, one of the broad-leaved type, will not bloom until it is seven years old.

Whatever may be the magic held in the number seven, it has no force in this case; for while it is true that many of the cacti are slow to attain the blooming size under ordinary cultivation. when conditions are just suited to their growth their flowers are produced much sooner.

As a rule, when a cactus shows signs of making a new growth, it is safe to water it moderately. During the periods of rest it should have only enough to keep it from drying up.

The rest period differs with the various species, but it can be easily determined with a little observation. The spiny varieties almost uniformly like a sandy soil, though some of these may be fertilized freely with liquid fertilizer when growing.

The Phyllocacti and other leafy stemmed varieties, require some loam with sand.

Those who like a profusion of bloom will find it hard to clip or pinch back all the lateral branches on the chrysanthemum, yet this is just what professional grower does to produce the mammoth show-blossoms. No plant can do more than a certain amount of work, and if the strength is concentrated in the terminal blossoms. their greater perfection will be the reward.

Phlox. and many other annuals, grow straggling if allowed to flower and form seeds in their own sweet way. To keep the bed sightly, one must continually pick and prune. It is a part of nature's plan to make us generous with her most beautiful gifts.

If you have been so unfortunate as to have a vase or porch box filled with plants which clash in color scheme, cut out the offending members. Scarcely a day goes by that we do not see the scarlet geranium and the crimson petunia growing side by side.

This is an offense to good taste. The petunia can be easily transplanted or cut out entirely, and started as a slip, making some spot beautiful, while it detracts from the appearance of the collection.

The florist may know all about raising thrifty plants, but he not infrequently errs in their arrangement.

THE PROPAGATION OF FERNS.

The ordinary way to propagate this class of plants is by dividing the plants, by the creeping rhizomes, by the little bulblets that form on the fronds, and by the seeds or spores that appear on the under side of the leaves.

The enterprising fern-lover will find it most interesting to propagate by spores, and perchance produce a really valuable addition to these beautiful and graceful plants.

Procure a seed-pan, or box, with plenty of drainage holes, and cover the bottom with broken crockery. On this place half decayed sod. and fill with carefully mixed and sifted leaf-mold and sand. Make the surface of the soil perfectly smooth and level, and then scatter the spores on it, and leave them without any covering, that is of soil. However, they must be enclosed in glass, by placing a pane of glass over the seed-box or pan.

Water, by placing the seed-pan in water, and keep it there until the water appears on the surface of the soil. Then remove at once, for too much water will destroy the spores. Keep the box in the light, but not the sun, remembering that ferns naturally grow in shady places, and that we should try to follow nature's lead.

Aim to have something new every year, but not a high-priced novelty. The sensitive plant is handsome and intensely interesting in its habits. If you have never grown it, try it for the children. Study its queer habits, and you will always find it entertaining.

Go over the lawn and pull the weeds, or cut them below the crown, especially the plantain.

Bees and Their Care

FOUL BROOD OF BEES.

From all parts of the country reports are received of foul brood, the ever-present disease of the country, because diseased hives, whose inhabitants have died, are too often left standing without any care on the part of the disappointed beekeeper. Some day we must hope that the law will compel the careless beekeeper to destroy or disinfect all infected hives, and thus render them harmless to his neighbor's bees.

This highly contagious disease must not be confused with chilled brood, so common in the spring, when the bees of the brood chamber contract their cluster, leaving the brood to perish of cold, or when the supply of food is reduced and insufficient for the daily wants of the hive, the brood dies of starvation. The dead brood, which is first white and then black, may often be found on the alighting board or on the ground around the hive. This is not a disease at all.

Symptoms.

Foul brood is of two types—one that is mild, and may, with care, be cured; and the second of a more virulent nature, and consequently almost impossible to cure. It is caused through a germ called bacillus alvei. The brood is first attacked generally, but the older bees may also suffer from the disease. We know that healthy brood occupies the whole of the central part of the frame or comb in a very compact manner, and should it be examined it will be seen that it is very white indeed, and plump, in a very healthy state.

Should disease germs find entry into a hive the color changes to yellow, then brown, and, if left, will contract to a mere scale. In its earliest state the brood loses its plumpness and firmness. The cappings of healthy brood are slightly convex and whole, but those containing diseased brood are covered with cappings concave in shape and often perforated. In the virulent state the stench is almost unbearable, even when the hive is closed, but in a mild state little or no smell is observed, though the conditions of the brood are identical.

The dead brood becomes a sticky, coffee-colored mass, and if a match stem be inserted into a cell, the mass is so viscous that it will adhere to the stick and stretch out in a long thread. By the time this stage has been reached the bees seem listless and uninterested, and may be found on the alighting board trying to ventilate the hive to rid it of its evil odor.

Remedy.

In the virulent case it will be best to destroy the bees, internal fittings and quilts, and thoroughly disinfect the hive, as described later. In the case of foul brood in its earliest stage, when the colony is not seriously reduced in number, then brush off the bees from the combs and make an artificial colony, placing the bees in a skep and confine them for about thirty-six to forty-eight hours without food. During this time the bees infected will die.

Prepare a clean hive with full sheets of foundation, using as many as the remaining bees will cover in a crowded state. Do not forget to burn the skep in which the bees were imprisoned. Cover up the bees warmly, and feed on the medicated syrup, which at this season of the year may be ten pounds of cane (white lump), seven pints of water, one ounce of salt, one-half ounce napthol beta solution, mixed as directed on the packet, and boil all, save the napthol beta, a few minutes, stirring to prevent burning. Give it to the bees luke-warm. All the operations must be carried out at night, to prevent the spread of the disease by robbing. The beekeeper himself can spread the disease by examining healthy colonies after unhealthy.

The old hives must be thoroughly washed with boiling water and carbolic soap. When the hive is dry, the sun should be allowed to shine upon every part, as far as possible, then we can paint it outside and in with a solution of carbolic acid, using twice as much water as acid. On the floorboard of the hive now occupied by the bees from the diseased hive place a naphtha-line ball. After handling a foul brood the beekeeper should wash not only his hands, but his clothes and all he has handled, including the smoker, in a solution of carbolic acid, using ten to twelve times the water, as acid.—American Cultivator.

SOME BEE HABITS.

In an eastern exchange in a description of a large apiary belonging to Mr. Horace Libby we note the following regarding bee habits:

"The drone is much larger and thicker than the worker and is the male of the hive. The queen is the female and may be called the mother of the whole colony and is still larger than the drone. The workers are much smaller and so far as sex is concerned may be called neutrals. It is their function to perform all the labor of the hive, to explore the surrounding country in search of honey, to supply all the wants of the queen, to defend the hive from all attacks, and to carry on hostilities against all enemies. The queen lays all the eggs, while the drones are the fathers of the colony and do nothing that savors of work. There is but one queen in a hive and

STAYCO CHOLERA CURE
After testing many different cures, we have found the Stayco Cholera Cure most effective. It is the best cholera remedy for turkeys. It prevents and cures roup, diarrhoea, cholera and other poultry diseases.
25 cent size $0.20

INSECT POWDER
For setting hens, young chicks and the dust bath. Death to all vermin. Not intended to take the place of Stayco Liquid Lice Killer, which is always needed in this mate.
2½ lb. package $0.31
5 lb. package..... .55

STAYCO SQUIRREL POISON
Composed of poisoned grain for the destruction of squirrels, gophers, rats, mice, etc.
1 lb. package.....$0.16
5 lb. package..... .70

STAYCO BED BUG KILLER
Liquid—Non-Poisonous
As the name implies, it is non-poisonous. It is also very efficient and safe, if used away from fire and open lights.
Per gal.....$1.75 Pint .....$ .35

BORDEAUX MIXTURE
Universally used for spraying all trees attacked by scale, aphis, and other injurious insects. Put up in concentrated form. Write for quotations, and specify quantity wanted.

STAYCO LIQUID LICE KILLER
Kills lice on poultry without contact with the fowls. Spray the inside of the chicken house—fumes do the work, and not injurious to poultry.
1 quart .....$ .25
½ gallon ..... .40
1 gallon ..... .65
5 gallons 2.75

STAYCO CONDITION POWDER
For Horses, Cattle, Swine, Poultry
No horse, cow, pig or chicken can be kept well at all times without some medicine to settle, help or cure digestion, stimulate the liver and kidneys and maintain all the functions of the body in a normal state. It is as necessary to give your animals such medicines as for you to take some physic, tonic or reconstituant at some time or other, with that difference, though, that you know, or should know, when you need to take it, whereas your animal does not.

Directions—Give every day to horses 1 heaping tablespoonful; cows, 2 tablespoonsful; sheep, 2 heaping teaspoonsful; hogs, 2 teaspoonsful; chickens, 1 tablespoonful for every 12 hens.

1 lb. package $0.19
5 lb. package ..... .85
10 lb. package 1.55
25 lb. pail 3.25

she is treated with the utmost kindness and affection by all the others. The drones are but a small portion of a colony and these are promptly killed by the workers after they have performed their function. The number of bees in a hive varies greatly at different times and runs all the way from two thousand up to fifty thousand.

"The anatomical structure of the bee is no less wonderful than its habits. They are provided with a long and flexible proboscis with which they can explore around the petals of any flower and scoop up the nectar which is passed along to the first of its two stomachs where it is clarified before being placed in the honey cell. The pollen of flowers is also collected by the bees as food for the young and stored in combs until it is needed. The pollen is not taken into the stomach but is kneaded into a ball of paste and attached to their legs. The wax of the bee is a secretion of the abdomen and is not made from pollen. It is probably separated from the nectar and may be called the residue of the honey.

"The instinct of the bee in gathering and storing honey is marvelous. In the bright lights its vision is keen and it alights unerringly on the flower that contains the nectar and then is just as certain in its flight homeward. When a mile or more from the hive it rises straight into the air and after circling around a few times takes the traditional bee line for home. They are very susceptible to both cold and heat and a temperature of 40 degrees will render them torpid. When clustered in the hive, however, they will stand a severe temperature without apparent injury. As weather prophets their instinct is infallible, and while hard at work in the fields will frequently quit all of a sudden and flying home crowd into the hive as quickly as possible. This is a sure sign that a sudden storm of some kind is close at hand.

"The construction of the comb is one of the marvels of geometry in which the bee excels the human architect. The geometric form of each cell in the comb is a hexagonal prism terminated by a trihedral pyramid, the three sides of which are rhombs which meet at the apex and form oblique angles with the sides of the prism. There is never the slightest variation in making these combs. Within recent years man has imitated these cells so that the bee is now relieved of much of this work and has more time to devote to gathering honey. The fact, however, remains that as an architect the bee has no rival in all nature."

BEE KEEPING FOR WOMEN.

It was no preconceived plan which made a bee keeper of me. It was one of those things which just happened. As long as I can remember we had kept a few bees at home. I took no part in their management, but have vivid recollections of wild rushes after my father when the bees were swarming. About ten years ago my father purchased some sixty-five colonies with the intention of going in almost entirely for bee keeping. For two seasons we were fairly successful. Then a series of hard winters, coupled with poor management, sadly depleted our stock, until in the spring of 1907 we were reduced to eighteen colonies, and only about three of these were in good shape.

During these years I had helped in the summer with the bees, and in the winter was attending school in Toronto. I left school ardent to do something for the betterment of the world. The world was perhaps wiser than I, and was not particularly appreciative of my efforts; so, somewhat discouraged, I undertook to build up our apiary and bring it back to a paying basis, partly because nothing better offered worth leaving home for, partly because I wanted some money, and partly because I desired to prove in some way that I really was some good. And thus I found myself really launched as a bee keeper.

My equipment consisted of a little general knowledge of bees, eighteen poor colonies, a good honey house, an extractor, and a cumbersome quantity of supplies equal to running about 150 colonies. I have kept no account of things, so for the years which follow I have to trust to my memory, and can give you only approximate figures. That first summer I was able to about double the number of colonies, but only had a small quantity of honey. My spring count in 1908 was thirty colonies; honey crop, 1,000 pounds; colonies put away for winter, fifty-five colonies. Everything promised wonderfully this spring. The bees were in nice condition. However, after the warm weather in March, which brought the bees out unusually early, the succeeding cold seemed to sap their energy. The weather during apple blossom and dandelion time was cold and wet, and the bees failed to fill up with brood. Then, before they were nearly ready for it, the clover was in bloom. The basswood was unusually good, which saved the situation somewhat; but even so, I only had about 1,600 pounds of honey. I had set my heart on increasing to one hundred colonies, but when the time came to pack up for winter I found I had to do a good deal of doubling in order to make them strong enough, as I have found out what I suppose every bee keeper finds, that it does not pay to winter weak colonies.

Much of my profit was also eaten up by the sugar I had to buy for winter stores; as the clover dried up the first week in July, the new colonies were very low in stores, and the old colonies were also nearly all light; but, in spite of the apparent discouragement of this year, I feel better satisfied with it than with any yet, as I am beginning at last to feel myself master of the situation. I have had practical experience in increasing, in doubling, in wintering, in queen rearing and in moving, and feel that I have a good basis for going ahead with. Although the amount of honey taken each year may seem small, it is partly due to the neighborhood, which is rather a poor one. The fall honey flow is hardly sufficient to keep things going, there is not much basswood, and alsike is not grown for seed.

When I speak of bee keeping to people who know little about bees, they usually exclaim: "But how do you manage about the swarming? Do you hive the bees yourself?" The experienced bee keeper knows that by proper management swarming can be almost overcome. The greatest difficulty to my mind is the heavy lifting, and on this account, unless a woman is fairly strong, it would be quite impossible for her to go into bee keeping on a large scale. Two girls can often work together with advantage. My sister sometimes helps me, and then we have no difficulty in lifting the heaviest hives. The hive lifting device suggested by some of the members would obviate much of this. Outside of the heavy lifting, there is no work about a bee yard which a woman of ordinary intelligence ought not to be able to do as well as a man; in fact, for the close attention to detail and the constant watchfulness, a woman ought to be specially fitted; and on these two elements success largely hinges.

Now for some of the advantages for a woman in bee keeping. In the first place, unlike poultry raising, all the work can be done in fine weather, in fact, has to be done. Even in the summer, unless during the busiest season, there will be a fair margin of time for other pursuits, and all the winter is free; the work is healthful, taking one into the open air and keeping one constantly in touch with the great world of nature. It will yield a good profit for a comparatively small outlay, the chief capital required being brains and perseverance. Most important of all, the work is interesting, even absorbing. Can you imagine anything more suggestive of peace and contentment than to stand in the midst of a bee yard, one's own bee yard, the sun beating down warmly, the air heavy with the fragrance of blossoms, sunshine glinting on flashing wings, and the air full of a steady hum which rises to a subdued roar? Then it is indeed that we know what a goodly thing it is to be alive.

Even for the woman who does not wish to go into bee keeping on a large scale, it can yet be made, in most localities, the source of quite a little income, especially desirable where there is a large family of girls, as well as providing a wholesome sweet for the table. I have in mind two friends who keep from ten to a dozen hives of bees, which on an average net them about $100 a year.—Ethel Robson.

Do You

Appreciate all the Advantages an Individual Pumping Plant Offers?

First—It insures a crop every year if you are growing fruit or vegetables. Other sources of water may fail, but a pumping plant is always on the job.

Second—Where properly used it produces a higher grade of fruit during any season.

Third—Many acres now occupied with crops earning low profits can be utilized for crops that yield much higher profits.

Fourth—It gives the land owner a greater independence than he enjoys at present, notwithstanding the fact he is more independent than any other class of business man.

Fifth—It makes possible at an extremely small expense a vegetable and fruit garden that will provide health and comfort for every member of your household.

Dow Pumps

are especially suited for independent pumping plants because of their high efficiency, absence of complicated balancing devices and moderate first cost.

Irrigation and Forestry

STREET AND ROADSIDE TREES.

By Ernest Braunton, Forester of Los Angeles County.

Too many of our street trees are chosen without consideration of their fitness. It is not enough that they should be pleasing in appearance. Some of the principal qualities required for a suitable street tree are here noted:

(1.) A compact stateliness and symmetry of general form and outline (with ample foliage), as distinguished from a wide spreading or a pendent tendency, so that the stem can be relieved of side branches to a height sufficient to allow a free circulation of air beneath, and also that they may not interfere with the comfortable use of the sidewalks and streets.

(2.) Healthfulness, so far as being exempt from constitutional diseases, and ability to withstand the many evils which city trees have to encounter, such as reflected heat from buildings, short supplies at times of water, and the same of soil.

(3.) Cleanliness, as characterized

Ernest Braunton.

by persistency of foliage, freedom from fading flowers, and measurably exempt from attacks of insects, such as leaf eaters, scales, etc.

(4.) Not liable to throw up suckers from the roots; of vigorous but not excessive growth. A tree of extremely rapid growth is usually short lived, but few of our evergreens are too rapid in growth, and deciduous trees are almost out of the question for Southern California cities.

(5). The branches should be elastic, rather than brittle, that they may better stand heavy storms and twisting gales, which are more prevalent in cities than happens in seemingly more exposed situations, though in our state we have far less than do they who live east of the Rockies.

Evergreens.

While it is, perhaps, not possible to select any one tree which possesses all of the above qualifications, we can select those species which experience has proved to approach nearest to perfection, and among the great numbers available, coming as they do from every land, we may surely find some tree that will suit the majority of those living on any street.

The following list is a very general one and includes nearly all those suitable for planting in Southern California. A few of them thrive in all sections, many of them quite generally throughout our end of the state, and a few in restricted localities only. In planting a considerable number of species, a thorough knowledge of local conditions and requirements is necessary as well as a keen discrimination in choosing the list for planting.

Schinus molle, Pepper Tree; Acacia dealbata, Silver Wattle; Acacia decurrens, Green Wattle; Acacia cyanophylla, Blue-leafed Wattle; Acacia melanoxylon, Blackwood; Acacia floribunda, Everblooming Acacia; Quercus suber, Cork Oak; Quercus agrifolia, Live Oak; Sterculia diversifolia, Bottle Tree; Eucalyptus callophylla, White Flowering Gum; Eucalyptus Polyanthema, Red Box; Eucalyptus rudis, Desert Gum; Eucalyptus ficifolia, Scarlet Flowering Gum; Eucalyptus amygdalina (narrow leaf) Messmate Gum; Eucalyptus robusta, Swamp Mahogany; Eucalyptus punctata, Hickory Gum; Eucalyptus sideroxylon, Red Ironbark; Eucalyptus leucoxylon, White Ironbark; Eucalyptus platyphylla, Broad-leaved Gum; Jacaranda ovalifolia, Trumpet-flowered Tree; Casuarina stricta, Beefwood, She Oak; Ficus macrophylla, Moreton Bay Fig; Grevillea robusta, Silk Oak; Pittosporum undulatum, Victorian Box; Pittosporum rhombifolium, Saw-leaved Box; Camphora officinale, Camphor Tree; Ceratonia siliqua, St. John's Bread; Albizzia lophanta, Crested Wattle; Ligustrum ovalifolium, Japan Privet; Nerium Oleander, Oleander; Calodendron Capense, Cape Chestnut.

Palms.

Trachycarpus excelsus, Windmill Palm; Washingtonia robusta, Mexican Fan Palm; Washingtonia filifera, California Fan Palm; Livistona australis, Australian Fan Palm; Erythea edulis, Guadalupe Palm; Cordyline indivisa, Dracena, or Palm Lily; Cordyline australis, Dracena, or Palm Lily; Cocos plumosa, Queen Palm.

Deciduous.

Platanus orientalis, Oriental Plane; Fraxinus lanceolata, Green Ash; Castanea sativa, Chestnut; Melia Azerdarach umbraculiformis, Umbrella Tree; Hicoria Pecan, Pecan; Quercus pedunculata, English Oak; Quercus lobata, California White Oak; Liridendron tulipifera, Tulip Tree.

* * *

The state law defining the duties and powers of County Boards is quoted in part as follows:

"The forester shall have power and it shall be his duty to enforce the provisions of this act and all lawful orders of the board and he shall be and hereby is vested with all the powers of a peace officer to make arrests for the violation of any of the provisions of this act.

"Every county board of forestry appointed under the provisions of this act shall, within their respective counties, have exclusive power over and jurisdiction to decide upon the variety, kind and character of trees, hedges and shrubs that shall be planted upon said roads, highways, grounds and property; and to determine all questions respecting the pruning, cutting and removal of any trees, hedges and shrubs now growing and to grow thereon and the necessity therefor and the extent of and the manner in which said work shall be done; and to enforce, carry out and effectuate the pro-

visions of this act; provided, however, that said board in the exercise of its powers and the performance of its duties hereunder, shall not interfere with the jurisdiction of the board of supervisors over the roads, highways, grounds and property in the improvement, care and general control thereof.

"It shall be unlawful for any person or corporation (except said county board of forestry) in any county or city and county where a county board of forestry has been created and appointed under the provisions of this act, to trim, prune, cut, deface, destroy or remove any shade or ornamental tree, hedge or shrub growing or to grow upon any such road, highway, ground or property, or to paint, place, attach to or put upon such trees, hedges or shrubs any sign, notice, advertisement or advertising device without the consent in writing of said board first obtained, or to plant any tree, hedge or shrub on any such road, highway, ground or property without such written consent.

"Every person who shall violate any of the provisions of the preceding section shall be guilty of a misdemeanor.

"All moneys received as penalties for the violation of the provisions of this act, shall be paid into the county treasury to the credit of the county board of forestry fund, which fund is hereby appropriated and the moneys thereof hereby appropriated for the expenses of said board in the carrying out of provisions of this act and the policy and purposes herein provided."

"PRACTICAL FORESTRY IN THE PACIFIC NORTHWEST."

The Western Forestry and Conservation Association at Portland, Oregon, has issued "Practical Forestry in the Pacific Northwest" which has to do with measures for protecting existing forests and growing new ones, from the standpoint of the public and that of the lumberman; it also gives an outline of technical methods. It is written by Mr. E. T. Allen, formerly U. S. District Forester and now forester for the association issuing the booklet.

There is a keen and growing interest in the subject and people of the western states realize that the forest is a community resource and that its destruction injures the community's welfare. Even the lumbermen are coming to regard timber lands not as a mine to be worked out and abandoned, but as a possible source of perpetual industry.

This book is issued by the association to gather together and place before the people information as to forest management as applied to western conditions. One hundred and thirty pages are given to discussion of these questions, and the volume should be valuable in the hands of the forester and in educating people to the needs of the Pacific Coast. A few sentences we note in it referring to the necessity of stopping forest fires:

"A San Francisco can burn down and it is soon replaced. Insurance and capital come to the rescue, labor is employed, and business is resumed. But when the forest burns, industry dies and labor is driven away empty handed. It is a big price to pay for neglecting the slight effort required to prevent it."

FARMERS AUTOMOBILES.

On the prairies of Dakota many farmers are using automobiles; the same is true of Oklahoma and other sections of the West. The automobile is playing a star part in the agricultural development of the country. One sees loads of milk cans gliding over the roads on the way to the dairy, or the tons of wheat going at a pace of thirty miles an hour; indeed, a strange contrast to the rickety-rick of the ox-cart, plowing its way hundreds of miles into Chicago, as it did fifty years ago. The automobile is used for utility, whether it be to carry the good wife herself with poultry, butter and baskets of eggs to exchange on Saturdays, when everybody "went to town" for a social meeting and day of "trading." The tonneau of the automobile holds the produce and she is soon free with hours to do her "shopping" now.—Joe M. Chapple.

Among the Giant Redwoods. —Courtesy State Forester.

OUR OIL ENGINE

Costs but little more and can be operated at one-half the cost of distillate engine and at less than one-third the cost of electric power at two cents a kilowatt. The average yearly saving on a 50 H. P. plant would be $1200.00 over a distillate engine and $3000.00 over an electric motor. If interested drop us a line, or better still, call and see engine in operation. We stock everything that goes to make up a complete power or pumping plant.

HOUSEHOLD.—Hallowe'en; On the Wedding Morn; Real Fun for Hallowe'en; Pretty Hallowe'en Fancies; Hallowe'en Feast; Fighting Ants; Homely Hints; Eggless Recipes; 409, 410, 411.

PRODUCE MARKET. Los Angeles Market, San Francisco Market, Deciduous Market, Citrus Market, 412, 413.

RURAL POSTAL SERVICE.

The Rural Postal Delivery Service now costs $36,844,968 a year to maintain 42,752 routes. Is is estimated that by 1915 the annual appropriation for this service will reach $50,000,000.

HONEY PLANTS IN CALIFORNIA

The State Agricultural Experiment Station at Berkeley is mailing Bulletin 217, "Honey Plants in California." Every beekeeper should write for it. It has been prepared by M. C. Richter.

FATTENING POULTRY

The Department of Agriculture has just issued Bulletin 140, "Fattening Poultry," by Alfred R. Lee. It contains some 60 pages with valuable feeding points and illustrations of crates and cars for shipping.

PERCHERON BREEDERS

The annual meeting of the Percheron Society of America will be held in Chicago at the time of the International Livestock Exposition. The meeting opens Monday, December 4th. This organization is succeeding and is registering more draft horses than all others combined.

BIG PREMIUMS

The National Dairy Show beginning in Chicago today and continuing until November 4th, is offering a total of over $15,000 in premiums and trophies. The largest single offerings are for the best five dairy cows of any breed. The first, second and third are respectively $1,000, $250 and $100.

BOX APPLES SHORT

Chicago reports from the Pacific Coast section a general shortage of apples. This, we think, is more true of other states than of Califirnia, for this state will have an output up to normal, but the eastern market is considering the situation with the output of box apples materially shorter than ordinary.

RAISINS SHORT

With the shipping of the first raisins well started it is apparent that the crop will fall short of even the earlier estimates. Drying is proceeding very slowly because of unfavorable weather. Some purchases have been made at the 5-cent mark. Hanford claims credit for the first car of 1911 raisins.

COMMERCIAL FERTILIZERS

John S. Burd, Chemist in Charge Fertilizer Control of the State University, is author of Bulletin 221 now being mailed by the Agricultural Experiment Station at Berkeley. It has a fund of valuable information as to fertilizers and a list of analyses of fertilizer samples forwarded to the control, giving value per ton of each.

ONE STEP.

The conservation talk has now resulted in one step in the right direction in the lumber industry. Heretofore all lumber has been sold in even lengths, causing vast waste, because often a log will produce a board an inch or so short of, say, 12 feet. This, under the custom which has obtained, could not be reduced to 11 feet and sold as an 11 foot board, but must be cut down to 10 or an even number of feet. In time 11, 13 and 15 foot boards may be found in our lumber yards. Some objection to the change has been raised by carpenters who have become accustomed to the even foot lengths, but the world's lumber supply is diminishing rapidly and is also increasing greatly in price, and this latter is doubtless the determining factor in the change.

APPLE SHOW

The Oregon Apple Show will be held in connection with the 26th annual meeting of the Oregon State Horticultural Society at Portland, November 15 to 18. The complete premium list may be had by addressing Mr. Frank W. Power, 1206 Yeon Bldg., Portland.

THE WRONG ENGRAVINGS

A regrettable mistake was made in last week's Cultivator in the bringing of engravings of the University Farm at Davis into the San Luis Obispo Polytechnic School article. The editor was away attending the Country Life Conference at Davis, which perhaps gave to the foreman license to reproduce scenes of the Farm. The San Luis engravings were all in hand and some of them are appearing in this week's paper. That school is making a most enviable record and is attracting pupils from all parts of the state.

HORTICULTURAL COMMISSION.

The long contest for a horticultural commissioner to serve for four years has been ended by the appointment by Governor Johnson of Prof. A. J. Cook of Pomona College. Prof. Cook has been sworn in and will on November 1 take up the work which has been laid down by Mr. Jeffrey who has filled the position acceptably for the last four years.

Prof. Cook comes to the office after a lifetime of work with insects, which abundantly qualifies him to fill the position. Prof. Cook writes asking for the support of all the fruit growers. We quote from his letter:

"I wish to thank sincerely the many fruit growers who have so generously, heartily and loyally recommended me for the position. I also wish to thank the late commissioner, Mr. J. W. Jeffrey, whose splendid service will make our work easier. He has won praise from a host of our best ranchers, which will spur us on to our best endeavor that we may win like favor. It is a superb opportunity for a grand service, and if splendid results are not forthcoming, then we shall be truly worthy severe censure. We bespeak the loyal support of all our ranchers."

IMPROVEMENT

A couple of years ago the Cultivator had occasion to criticise the surroundings of the University Farm at Davis, a small town which asks to be made an educational center for rural youth. The criticism was upon moral conditions and the unattractive appearance of many of the streets. A visit this year shows material improvement in one line, for while the large number of saloons mentioned in the former article still exists so far as indicated by signs on the doors, the doors are now locked and the business closed up. This resulted from an act of the legislature, not from any advancement at Davis. This is to be regretted so far as Davis is concerned, because an opportunity was lost to take up an enlightened position before the other communities of the state and show that she appreciated the location of a great educational institution at that point. Perhaps the incident points a greater lesson in this that the performing of this act by the state carries more weight than if done by one small community. Be that as it may, the saloons are closed and doubtless a cleaner moral atmosphere will obtain.

Along the streets a generally cleaner appearance prevails, but it must be confessed that the pigsties still adorn the main approach to the farm. In this connection it may be in order to refer to the effort of the better element of the place to incorporate. This should be encouraged as it will give strength for every step leading toward the betterment of the community.

SALT IN CYANIDES

Much concern has been felt by orange growers because of the salt content of a large shipment of sodium cyanide secured for purposes of this fall's fumigation. Prof. Woglum has recommended that the content of sodium chloride in the cyanide should be less than one per cent in order to secure fullest action of the gas and best results on the pests. Samples from this large shipment were taken for analysis and some of them showed as high as 18 per cent of sodium chloride. In view of Prof. Woglum's recommendation it appeared that this great quantity of cyanide would be a total loss. Samples, however, were sent to the chemistry department of the college of agriculture at Berkeley and Mr. George H. Colby and Mr. George P. Gray made extensive experiments and analyses. In their report of these experiments they refer to the former opinion as to sodium chloride reducing the efficiency of the cyanide and say according to these tests the salt in these samples submitted "would decrease the efficiency one-third, requiring the use of one-half more cyanide to produce the same amount of hydrocyanic acid gas." These chemists undertook a special study of the subject and decided that the method of analysis in the past had given different results from the chemical action in the fumigation in the field work. For purposes of analysis in the laboratory the cyanide had been placed in solution. These gentlemen then followed in their laboratory the procedure followed in the field, and as a result of their experiments have determined that the presence of sodium chloride is of little consequence. The four general conclusions of these chemists are as follows:

First—Where there are no chlorides present the total available cyanogen is nearly all converted into hydrocyanic acid gas.

Second—When chlorides are present and the gas is generated from solid lumps a very small amount of decomposition occurs.

Third—Cyanide in solution suffers very great decomposition during generation when chlorides are present.

Fourth—The commercial cyanides now being used are good for fumigation purposes even if they contain the largest amount of common salt yet found, provided the hydrocyanic acid gas is generated by the method usually followed in practice.

When doctors disagree it is time for the layman to be careful, but we hope some very carefully observed experiments will be made which will in the course of a few months give, if not conclusive, most helpful lessons.

Agricultural News Notes of the Pacific Coast

Northern California

Sutter County's bean harvest is ended.

Last Thursday, the 19th, was wool sale day at Ukiah.

The high school at Napa has established an agricultural course.

Willits recently held a most successful four-day agricultural fair.

A Sacramento County beekeeper reports a fairly good honey season.

Santa Rosa, Sonoma County, is sending several cars of prunes to Germany.

California barley has been in greater demand by eastern brewing companies than ever before.

The Ferndale Chamber of Commerce is being urged to take up the matter of gopher extermination.

A 2000-acre tract near Badger Hill, Eldorado County, is being subdivided into 20 and 40-acre fruit ranches.

A large party of colonists recently visited Biggs, Butte County, and land will be purchased in that section.

The Sutter Drainage District has been sued for damages because of overflowing ditch drowning grain crop.

The plant introduction garden at Chico, Butte County, is making many improvements and adding new plants almost daily.

Oroville's olive crop will be the biggest in its history and the Ehmann Olive Company is putting up its finest pack of olives and oil.

Prof. Geo. C. Husmann is looking for a tract of land in the Sacramento Valley to be used for experimental planting of resistant grapes.

Shasta County's highest price for hops was given last week at 35½ cents. The crop of Twin Valley in that county will run about 70 bales.

A new forage plant introduced from the West Indies is being tested in Yolo County and is showing a ten-foot growth and fifty tons of fodder to the acre.

A new town with the distinctive name of Dairyville has been established in Tehama County. It is located in the center of a rich alfalfa section.

The secretary of the interior has released over a half million acres near Shasta National Forest and entry on these lands may be made after December 26th.

Ukiah, Mendocino County, reports the hop crop of surrounding sections harvested, and with few exceptions baled. Prices have ranged from 10 cents on old contracts to 42½.

The creamery companies of Humboldt County are making strenuous endeavors to prevent feeding of turnips to dairy cattle, as it imparts disagreeable flavor to the butter.

Horticultural Commissioner McBride of Solano County is urging eradication of thistle. It is hoped to have the services of another inspector next year in Maine Prairie Township, where the pest is most abundant.

Sugar beet planting has been engaged in in northern Solano County for the purpose of testing the soil and ascertaining the possibilities of sugar beet growing. The test is said to be in the interest of the Sacramento Valley Sugar Company.

Central California

Santa Cruz is planning to have an egg exchange.

Santa Cruz County is planning for a big tree boulevard.

Salinas recently sold 2,500 sacks of Chevalier barley at $1.72.

The Kirkman Nurseries plan the opening of new yards at Madera

A committee has been appointed to form a raisin exchange at Fresno.

Hughson shipped seventy-five cars of baled alfalfa during September.

Stanislaus County Poultry Show will be held at Modesto November 16-18.

Dairymen at Salinas have been fined ten dollars each for unsanitary dairies.

Squirrel "owners" are to be prosecuted if they do not rid their lands of the pest.

Many licenses have been taken out by sportsmen for duck hunting on Tulare Lake.

Gilroy orchardists are planning to put out many French prunes the coming season.

Three degrees of quality of cream are to be established by the dairymen of Tulare County.

Stanislaus County is urging the planting of more olives, maintaining conditions there are perfect.

The east side and west side of Tulare County are contending as to which offers the best route for the state highway.

Tulare County orange growers will ask the President to aid in securing a more definite "green orange" ruling from Dr. Wiley.

Fruit growers of Kerman have formed an association and meet regularly to discuss spraying and other cultural matters.

Tulare claims to have shipped from ten thousand to twelve thousand hogs this year to the Los Angeles and San Francisco markets.

An auxiliary reservoir for the Modesto Irrigation District has just been constructed. It is three miles wide and seven miles long.

Rangers in charge of the Sequoia and General Grant National Parks have declared war on squirrels and other destructive rodents.

At a -meeting of fruit growers at Sacramento recently the matter of uprooting many of the table grape vines of the state was discussed.

The Farmers Union and Milling Company's warehouse in Stockton is nearly finished. It will have storage capacity of 20,000 tons of wheat.

A petition has been filed for the formation of the Wilbur Reclamation District on the west shore of Lake Tulare. The district will contain about 27,000 acres of rich land.

The Tulare County citrus growers have asked for an inspector from the Department of Agriculture to determine as to ripeness of oranges before they leave the packing house:

One striking feature of the Apple Show at Watsonville was a parade of apple wagons. Seventy wagons were in line, carrying a total of 14,000 boxes. This was to represent an ordinary half day output of Pajaro Valley orchards.

Southern California

The latest town established in Imperial Valley has been named Barba.

The Walnut Growers Association of Southern California is composed of 17 affiliated associations.

An auto truck is delivering apples from the Yucaipa Valley to San Bernardino and Redlands.

A carload of registered Berkshires has just been placed on the ranch of J. F. Weaver of Imperial.

Extensive plantings will be made of olives in the Hemet-San Jacinto section during the next year.

A movement has been started in Los Angeles to secure a closed season for all deer for five years.

Cattle on the mountain ranges above Hemet are being driven over to the desert ranges for the winter.

Plans are now being perfected for the National Orange Show to be held in San Bernardino February 19-24, 1912.

Oak Glen, San Bernardino County, is elated over the winning of nine prizes at the Watsonville Apple Annual.

One olive grower at Hemet has been offered $120 per ton for all his olives suitable for pickling and $55 for oil olives.

The walnut growing counties of the southern part of the state estimate this year's returns from walnuts at $3,500,000.

San Jacinto grain growers are balancing the year's accounts and find that barley at $1.45 is an exceptionally profitable crop.

The Golden State Cannery at Ontario has finished on peaches, and is now starting on tomatoes, of which it will put up some 50,000 cans.

Two carloads of machinery have been received and will be installed in the plant of the California Eucalyptus Lumber Company at Oxnard.

Olive growing has received an impetus since the enforcement of the pure food laws. An olive grove at Hemet recently brought a thousand dollars an acre.

The Elsinore and Wildomar districts, in Riverside County, are finding olives and walnuts very profitable crops, and are planning for largely increased planting.

Lemon growers of Southern California are gathering a fund of information for the edification of congress and if possible to secure retention of the present tariff on lemons.

The walnut growers of West Covina, Irwindale, Walnut Center, Bassett and Puente have formed a pool of their 1911 crop of about seventy tons. They will sell outside of the association.

To test the keeping qualities of Muscatel grapes, an Escondido grower has shipped two fifty-pound barrels of grapes, packed in redwood sawdust, to Pasadena for cold storage until Christmas.

The biggest increase in the production of lima beans on one ranch in Ventura County is reported from Saticoy; it was 1300 sacks on the entire ranch, the average yield per acre being 45 sacks.

The Coast

Yuma, Arizona, observed Clean-up Day October 13.

There are over 20,000,000 acres of tillable land in the state of Oregon.

A poultry show will be held at Kalispiel, Montana, during December.

Something over 8,000 acres of land will be developed through irrigation near Reno, Nev.

Over 200 boosters from Canada attended the Dry Farming Congress at Colorado Springs.

With the beginning of cool weather work will be resumed on the canals and levees of the Yuma project.

An immense poultry culture project has been launched in the Umpqua Valley. 900 acres will be devoted to it.

A prune grower near Vancouver, Washington, picked twenty-four tons of green prunes from 400 trees seven years old.

The late rains over Southern Arizona have brought up a fine growth of grass in the last two weeks in valley and mesa.

Three thousand head of fine beef cattle were recently sent from Klamath County, Oregon, to Kern County, California.

The method of electing delegates to the State Grange of Oregon was changed so that every member will now have a voice.

It is now found that 500 families living on 80,000 acres of fertile land on the Salmon River in Idaho, have no title to their land.

Extensive efforts are being made by the Amalgamated Sugar Company of Utah and Idaho to encourage growing of sugar beets in Oregon.

Wenatchee, Washington, reports Winesap, Delicious and Black Ben apples will run larger crop than last year, while Jonathans are much lighter.

Farmers in Alaska claim that they are able to raise ten pound turnips as tender as apples. Carrots, celery and other crops also take kindly to Alaskan conditions.

Engineers in charge of the Klamath Irrigation Project report that the government will spend during the next year $200,000 for completing canal to irrigate Poe Valley.

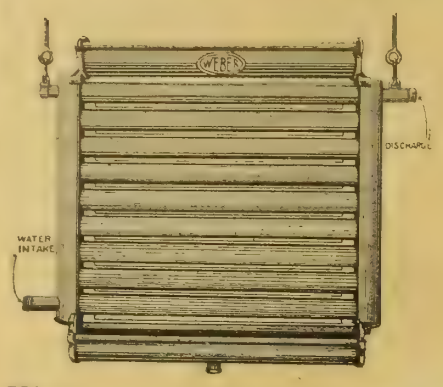
A delegate from Klamath Falls recently visited the Sacramento Valley to study sugar beet culture and has much enthusiasm for an effort at sugar beet culture in Oregon.

The National Mohair Growers Association will hold its annual convention in San Antonio, Texas, in November. The mohair output of the United States is extremely short this year.

Superintendent Carnes of the state insectary has returned from his trip to the Hawaiian Islands and reports the work of the Mediterranean fruit fly as extremely destructive to the fruits of the islands.

The state farm at West Stayton, Oregon, has been experimenting in the planting of corn and other crops in different plots, some of which were irrigated and come not. The returns are so favorable to irrigation as to be almost startling.

Weber Milk Coolers



WEBER COPPER TUBULAR COOLERS FROM $18.00 UP

We manufacture our own Coolers and can supply Coolers and Aerators, any capacity, from one cow to 20,000 pounds per hour.

SEE OUR
Weber Cone Coolers

Sanitary and Durable, complete with 12-quart tank, $4.50. Will cool 30 gallons of milk per hour to within three degrees of temperature of water.

Easy Money For the Dairyman

Your money comes directly out of your cows. It makes a wonderful difference to your pocketbook whether your cows produce much or little. Have you ever realized what even one quart a day more from each cow means to you? Say three cents a day—that's more than $10 a year. With only ten cows it means $100 a year. Looks pretty big all in a lump, doesn't it? Now it's just "easy money" to get that extra quart, and oftentimes two quarts, by a simple and cheap change in your feed.

We are blessed in this country with nature's richest gift—"Alfalfa," which we all agree is an unrivalled feed for a dairy cow—but even the best should not be used alone—cows, just like human beings, need variety. Alfalfa is rich in protein, but is light in carbohydrates. A cow, in order to make the most milk, must have in her ration a sufficient amount of both classes of feed.

STEAM-DRIED BEET PULP
Just Like Roots
Makes More Milk

In Steam-Dried Beet Pulp is found the ideal combination with alfalfa to make a properly balanced ration. It is light, bulky, succulent and easily digested, absorbs water very quickly and swells to about six times its original bulk. It is cheaper than bran or rolled barley and produces better results.

The combination we recommend is 8 lbs. of Steam-Dried Beet Pulp with all the alfalfa hay the cow will eat, which will be from 15 to 20 lbs. daily. It has also proven to be a splendid green food for poultry. They are extremely fond of it. Steam-Dried Beet Pulp is just the clean beets from the sugar factories (only the sugar extracted), which is **dried by steam.** Be sure you get the kind that's **steam dried,** always uniform in color and quality, never burned or blackened by smoke, always clean and pure. It is packed in 100-lb. sacks and will keep indefinitely.

Progressive feed dealers are rapidly placing Steam-Dried Beet Pulp in stock. Ask your dealer for it. If he does not keep it, write us. We will see that you are supplied promptly.

Live Stock and Dairy

Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.

BREEDING.

By Mrs. M. E. Sherman.

In speaking of the cows in my last article I ended with leaving out that important matter of good looks, for if a thing is good why not have it look so? Why have a sway back with a hump at the tail of a dairy cow when it does not increase the quality of the cow greatly? I have been collecting pictures of the great cows of every breed. I find that none of these things are necessary to production but are defects in the animal. The necessary things all these great cows show are the broad mouth, the big stomach, the large udder, the well-placed teats. We have our fads, all of us, and while some good authorities say that the skin of a cow or rather what is called the handle of the hide, has nothing to do with other qualities. I certainly find this hard to believe. In my cows the good feeders have shiny hair and soft feeling skins. The same is true of horses as it is of cows. The cow or horse that assimilates the food well has the smooth handling. When I go over the herd if I find a cow looking rough, I know she is wrong and give her extra feed of rich food to build her up into health.

Dry Skins.

In the sanitariums for mankind the skin of patients is examined and if it is harsh and dry, water is ordered in large quantities and watery foods. Now as long as cows receive abundant watery food such as silage, they do not have dry looking weedy hair on them. When a cow is thin the hair is dry looking. Now on old cows to hold condition, oil cake is needed in small quantities. I often take the old cows out of the herd, that is the very old ones, and put them into a small sheltered corral where they can have extra feed and more quiet. These old cows in a registered herd give us some of our best heifers. They have been tested as producers, they have been found to have the ability to handle food and stand the long strain of continued milking. They have had the ability to perform. In old age a form of mal-nutrition may be developed in a cow as in human beings. When the liver grows sluggish there is auto-infection. This reminds me of a story I heard at a dinner party the other day. We were talking of the prizes awarded to the cows at the fair the week before, when one of the men got off this story: "We had our cow do a funny thing the other day. We left a pail of gasoline standing in the yard. She tasted it, liked it, and drank it down. There was soon a wild time in the yard. The cow was galloping around yelling Honk! Honk! Honk! When we saw the empty bucket we knew she was suffering from 'auto-infection.' We could not get her into the stable, so put her into the garage and then cut a hole in her hoof to keep her quiet until the effect of the gas passed off. You see, she thought she had blown up a tire when the hoof was punctured."

Poor Sires.

The waste and loss from pedigreed scrubs of all kinds has never been so forcibly brought to mind as in the past few weeks of looking over animals at two fairs. In the herds the beef men have had more uniform animals than any other classes. The dairymen are waking up a little but are still a bit pedigree mad. I have seen a few scrub eastern bulls put over a herd of good cows. When will we use our common sense and forget to be hypnotized by performance of a remote ancestor of an animal. Have a good individual at the head of your herd. Have him with all the breeding you possibly can buy, for your money but have him good in himself first of all. It is a hard thing to say, but eastern breeders evidently think that the customers of this coast will not come back again to them anyway, so they can send them poor stuff. This is short-sighted policy and will react. What can a man think when he goes miles away from home, buys a sire and brings him over the mountain on that long tedious trip, proudly takes him to a fair and then has bulls bred by his neighbors take firsts, seconds and championships over him. It hurts that man badly, for he was probably hypnotized by a big pedigree and blinded by his own desire for something extra good. At first doubtful he at last comes to believe there is nothing better than his animal. I always pity these young breeders who are not hardened to the fairgrounds judgments. The pedigree fad is worked for all it is worth in this city.

The Whiting Jersey Stock Farm Co.

Is making the very best strains of blood from the Island of Jersey a specialty. Whiting Jersey Stock Farm Co. Heber, Cal

A sire of exceptional merit has a string of pure-bred daughters that are performers. He also has a string of sons. The dams of these may not have been extra good cows. Now from a breeder's standpoint the grandson of this great sire from a tested daughter is more apt to be great than his own son unless that son has a dam of great merit. Here is where so many are deceived when trying to improve their herds. The son of a great producing cow is worth more than the son of a great producing sire. If one can have both sire and dam great then the transmission is as certain to follow in every physically perfect heifer as anything we know of in this world of ours.

The sires that are sent here are often a disappointment, yet many good ones do come to us. The eastern breeders are much higher in prices than the California breeders, and we naturally expect the animals to be better than the locally-bred ones. In choosing a sire it is better often to take a good individual from a neighboring herd rather than to buy one of these "degenerate sons of noble sires," and use him on the herd.—M. E. Sherman.

Judging Polytechnic Stock at San Luis Obispo.

SPANISH PEANUTS FOR SWINE.

By P. N. Flint, Professor of Animal Husbandry of Arkansas College of Agriculture.

The Spanish peanut is generally recommended as a crop for swine feeding in preference to other varieties, because of the fact that it will grow under a wider range of conditions as to soil and climate, and also, because of its upright habit of growth, which allows easy cultivation.

The Spanish peanut is small podded; bears abundant foliage, and the stems grow upright. This variety frequently yields as high as 60 bushels of peanuts per acre.

Feeding Value.

The peanut kernel is highly nutritious and rich in both protein and oil. It has a nutritive ratio of about 1 to 4.2 which shows it to be a protein feed, and therefore good to combine with corn, since the latter feed is deficient in that food nutrient. The following is an average analysis of the peanut kernel: 26.6 per cent protein, 16.7 per cent carbohydrates, and 42.0 per cent fats.

Hogs are generally allowed to gather the peanuts themselves, and they generally consume some of the vines in addition to the pods and kernels. The vines have a feeding value somewhat similar to clover hay. Peanuts are relished by swine, and, since they yield well and furnish a concentrated source of nutriment, they are well adapted as a hog feed.

Polytechnic Butter Made at San Luis Obispo State School.

Soil Preparation and Requirements.

Spanish peanuts do best on a well-drained sandy loam soil, but may be grown under a wide range of conditions. Soils that become very hard are not well adapted to peanut growing owing to the fact that the pod stems cannot penetrate the surface. A poorly drained, sour soil is also unadapted to peanut growing and where such conditions exist, air slaked lime should be sown upon the soil at the rate of 1000 to 2000 pounds per acre, and if possible the soil should be drained.

Too much stable manure produces abnormal tops, and should not be applied in very great amounts, unless it be the previous year to some other crop. If the soil is low in fertility it is ordinarily best to apply about 200 pounds of acid phosphate and 100 pounds of kanit per acre.

The peanut belongs to a class of plants known as legumes, which are nitrogen gatherers, or soil improvers. Peanuts, therefore, enrich the soil in nitrogen, and, in case they are pastured they add considerable vegetable matter to the soil.

The soil should be well prepared, and, as a rule, level culture is best. If

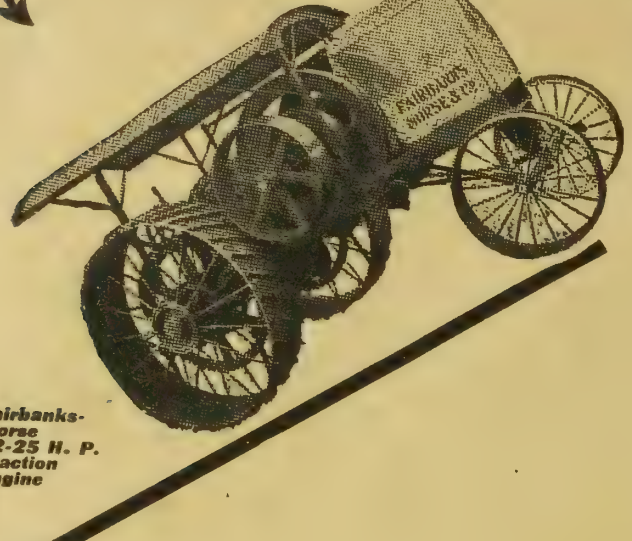
This Traction Engine Will Pull Loads



Fairbanks-Morse 12-25 H. P. Traction Engine

UP GRADES OF 25 to 27%

A recent customer who bought one of these engines writes us as follows:

"On account of the rolling condition of my land, I had serious doubts of your Traction Engine fulfilling your guarantee, and my anxiety prompted me to make an immediate test. It was my intention to first try it upon pulling a hay baler, which weighs approximately four tons, and the engine was attached to this. With no difficulty the engine pulled the load, without loss of speed, up grades of at least 10 per cent.

"The next trial of importance was to get the Tractor up a hill where grades of 25 to 27 per cent were encountered. It was here that I received my greatest surprise. You know I had a 20 H. P. Fairbanks-Morse Portable Engine, and this required twelve horses to pull it up these same grades. Your Traction Engine went up without any difficulty, which was more than sufficient to satisfy me that your guarantee had been fulfilled. The trial lasted six hours; up hill, down hill, over rocks and boulders—just about as rough a country as could be imagined—it went without trouble or worry."

the drainage is very poor it is sometimes best to throw up slight ridges and plant the peanuts upon them. This is especially desirable during seasons of excessive rainfall.

Since peanuts easily become weedy, it is best, if possible, to harrow the soil once per week for three or four weeks before planting so that the germinating weed soils will be destroyed. Crab grass is one of the worst enemies of the peanut.

It is best for the soil to plant peanuts in rotation with other crops. A good rotation is corn followed by peanuts and the peanuts followed by rye for winter grazing. They can also be planted after oats are taken off in June, in which case they will be ready for grazing by the latter part of September. When planted in early spring they will be ready for grazing by the first of August.

Planting.

Spanish peanuts should not be planted until the ground has become thoroughly warm. It is best to plant them in rows from thirty to thirty-six inches apart and six to nine inches in the drill. The seed should be planted about two inches deep. At the last cultivation the soil should be thrown towards the rows. They should not be cultivated after the pods begin to form.

It is sometimes customary to soak the seed over night before planting. This is done to insure quick and even germination, and is perhaps quite desirable if the ground is dry. If the soil is quite moist soaking is not so necessary. One disadvantage of this method is that the seed must be planted at once after soaking or they will spoil.

It is also quite customary with some varieties to shell the seed, but this is not so necessary in case of the Spanish variety as the pods are usually well filled and no great disadvantage results when there is more than one plant to the hill.

If shelled there should be planted from a peck and a half to a bushel of peanuts per acre, while if planted in the pods the rate of seeding should be from two to four bushels per acre. Spanish peanuts will mature in about 90 days.

Feeding Peanuts.

The best method of feeding peanuts is to allow the hogs to gather the crop themselves. This method saves the expense of pulling and hauling, and if portable fences are used so that the hogs can graze over but a small area at a time, the waste of peanuts will be greatly reduced. It is generally considered that an acre of Spanish peanuts will furnish grazing for eight or ten hogs, weighing in the neighborhood of 200 pounds, about thirty days. However this depends upon yields, size of the hogs and the quantity of other feeds fed in addition to the peanuts. For best results it is advisable to feed corn in addition to the peanuts. By so doing, not only will greater gains be secured, but a much better quality of pork will be produced than in case the peanuts are fed alone. However, if corn is quite high in price it might be more economical to produce the bulk of the gains on peanuts alone and simply finish the hogs off on corn during the last three weeks of the fattening period. When fattened on peanuts alone a soft, oily pork is produced which does not generally find high favor upon the market.

The cost of producing pork can be greatly reduced by growing and feeding Spanish peanuts.

Veterinary

Request some qualified veterinarian to examine carefully for decayed, loose or split molar teeth.—F. G. M.

Profit in the Poultry Yard

ractical poultry people who may have as from their experience as to methods feeding and housing and general care of try will confer a favor upon the Culti- r and its circle of readers by sending oncise accounts. Mrs. Basley is always ng to answer queries, which with the erience of others should make this a st valuable feature in poultry life on the st. Opinions or matters of a personal ure should be omitted, but a concise tement of facts is always valuable.

AKLAND'S BIG POULTRY AND PIGEON SHOW.

The Alameda County Poultry Asso- ation will hold its eighth annual ex- bition in Oakland, Nov. 21st to 27th, 11. The coming show will eclipse former exhibitions. The associa- on this year offers handsome useful ophies such as solid silverware, high ade cut glass, hammered brass and milar articles. This will be a de- ded change from former years and ill surely meet with the approval of . Specialty judging will be a feat- re, as each judge employed is an xpert in the classes he has been as- gned. The awards will be placed by arry H. Collier, of Tacoma, Wash., . J. Venn of Fresno, and L. N. Cob- edick of Oakland. With the three dges all awards will be placed be- re the end of the first day. The hibition hall is an ideal one, being cated at 1250 Webster street, right the business district, containing 2,700 square feet, giving ample room r the combined exhibitions of the lameda County Poultry Association nd the California Pigeon Club, there- y giving the public two shows for ne price of one. The officers of the oultry Association who will have harge of the coming show are W. E. ibson, president, Jas. Stansfield, vice resident, C. E. Ross, superintendent, nd W. T. Frost, secretary, 2821 Thir- enth Avenue, Oakland. Copies of the 2-page premium list will be mailed pon request by the secretary.

MODESTO POULTRY SHOW.

Modesto, county seat of Stanislaus County, will have its first poultry how, Nov. 16-18, 1911. The above- named county has climbed from four- eenth place to first, in the dairy busi- ess in seven years, and Secretary J. W. Guyler of the Poultry Association, ays they are going to duplicate that erformance regarding the raising of oultry. He states that the whole country is excited over the work, and hat the field is virgin for those who nay have good stock or fine hatching eggs for sale.

On account of their abundant field, excellent markets and rapid settle- ment of small acreages, the outlook is bright, indeed, for the future.

Secretary Guyler will be glad to send premium lists to those interested.

RECREATION CENTER.

The supreme concern of the com- munity, whether of the crowded city or the country crossroads, should be to supply youth with wholesome enter- tainment under wholesome environ- ment. Our school system offers the opportunity. Every school should be a recreation center. It should have ground for baseball, football, tennis and outdoor sports. The building should have a hall, furnished with chair for lectures, stage for plays and moving pictures, good floor for danc- ing, and music, a pianola and a graph- ophone. The cost? Do we not pay out for courts, reformatories and pris- ons more than would support these recreation courts? And who can measure the price of one youth gone wrong?—La Follette.

Napa.—Jan. 4-6, 1912. Napa County Poultry Association. Wallace-Rutherford, secretary.

Oroville, Butte County, is getting ready for its annual citrus show.

The express monopoly was never so beset from all sides. To the activities of the government and of the interstate commerce commission are being added the efforts of numerous organizations of business men and of other classes. The railway commissions of the different states are also taking up the question and will consider a general lowering of rates in the various states with an idea of securing some uniformity of action and perfect fairness to the express companies as well as to the public. A committee appointed by the railway commissioners is preparing a report showing that the value of the property used by thirteen leading express companies was only 12 per cent of their total assets, the other 88 per cent being surplus wrung out of the public through high rates. The net operating revenue of the express companies, even then, is 51 per cent on the value of the property and equipment. The more the express monopoly is investigated the more the average citizen wonders how it has escaped supervision all this time during which the railways, gas companies and other public service corporations have been so closely looked after that it has often been hard for them to earn a reasonable income.—American Cultivator.

TANNING WITH WOOL ON.

The following recipe for tanning skins with the hair, wool or fur on, will be of service to readers:

While the skin is fresh powder the flesh side with a mixture of salt two parts, alum and saltpeter each one part, and roll tightly, letting it lie until the mixture is thoroughly dissolved. This mixture should be pulverized before being applied. Next stretch the hide on a board and scrape off all flesh or membrane that may adhere to it. Dry in the sun and cover with neat's foot oil, after which it should be laid away for a few days. Then scrape as clean as possible with a piece of wood and apply Spanish whiting, which has been heated in an oven until it is hot, rubbing it with a flannel cloth. The skin is now ready for use and if at all stiff may be rubbed and worked soft with but little trouble.

(1) Cover the flesh side of the skin with pulverized alum, roll up for four days, then rub dry, with pulverized chalk. (2) Make a pickle of one gallon of water, one pound of salt, one pound of alum and a quarter of a pound of blue vitriol. Keep the skins in this in a warm place one week; then pull soft while drying.—Ex.

We'll Get You Yet
We'll Sell You Proper Poultry Food
Modern poultrymen realize that to be successful the best and most nutritious food must be given to their flocks, from the little downy peeper to the laying hen.
It isn't a question of choice. It isn't a question of whether you want to or not. It is just necessity in meeting modern conditions.
We Meet This Condition By Furnishing Food That Gives Results
Our chick food will keep your chicks well and growing and enable you to have a greater number than upon any other food on the market. Our egg food gives your hens material for egg production. Cresoline is sure death to mites and other noxious bugs. Coulson's Insect Powder will free your flock from body sucking parasites.
Are You In Touch With Us?
If not, we want you to join our army of successful poultry raisers. They are successful because they adopt right methods in feeding and care.
We publish several booklets which will interest you. They may be had for the asking.
You can get our foods from any reliable poultry supply house. Insist on getting them. Look out for substitutes said to be "just as good," "practically the same," etc. Any dealer who tries to sell you an inferior food when you ask for Coulson's is not your friend.

ADVANTAGES OF HAVING GOOD POULTRY.

Entirely too little attention is given to selecting poultry for general use. One might read an article that lauded the Plymouth Rock or Orpington fowls, and from that might decide to have some of that breed. The fowls are procured and turned loose on the farm to mix with those already there, which may be Rhode Island Reds, Wyandottes, etc., and the result is that the stock is poorer than ever before. Those who keep poultry on farms, or elsewhere, should keep them separate during the breeding season and not intermingle or cross-breed one variety with another, except to produce market poultry, and in such instances all the cross-bred fowls should be sold to market and none kept for breeding.

More attention should be given to poultry on farms than elsewhere. Some may say that they do not care to breed exhibition poultry, but it will always pay the farmer to breed his poultry just as carefully as fowls can be bred for exhibition. It is not necessary to spend large sums of money for prize winning fowls, nor to keep the poultry on the farms in the same way that they should be kept for exhibition, yet the poultry should be cared for and properly housed, because such care will bring good returns.

An instance of this kind occurred during the past season. One who had kept poultry for about 20 years, became interested in the subject of proper breeding. Over a year ago he bought a thousand day-old chicks from which he reared and selected 460 pullets. He sold all his other fowls, and from each of these 460 pullets more than $2.00 worth of eggs was sold during the months of December, January, February and March, making 50 cents a month from each hen. These results were so satisfactory that the farmer has made arrangements to have 1200 laying hens and pullets and has his house now completed and the pullets almost ready to go into them. His statement is that when a man knows how and applies his knowledge to poultry growing, he can easily make more than $2.00 a year net from each hen.

Another feature for consideration is the color of the egg shell. If your market demands white-shelled eggs, select fowls that lay white-shelled eggs; if your market is suited with tinted or brown-shelled eggs select fowls that lay eggs with tinted shells. Always select the fowls from a true bred variety and keep them pure and true.

If you want to keep fowls that lay white-shelled eggs and those that lay colored-shelled eggs, select two varieties, and breed them separate or separate enough of each to lay eggs for hatching and hatch and keep the chicks separate. Never mix varieties to produce offspring for laying eggs, or for market.—Poultry Item.

SATISFIED HER.

"Pardon me," said the haughty lady on a marketing expedition, "but are these eggs fresh laid?"

"Absolutely, madam," replied the grocer promptly. "The farmer I purchased those eggs from won't allow his hens to lay them any other way."—Calais, Me., Advertiser.

See that the chickens are not overcrowded at night, for they sometimes get hot and sweaty, and when let out in the morning catch cold, which develops into roup.

EGG EATING.

In my long experience with hens I never had but two experiences with the egg eating habit. Invariably I planned to keep my fowls busy and thus out of mischief and bad habits. But the habit developed twice in my flock in spite of every precaution I had taken. No poultryman of any extended experience but what has had to deal with this pernicious habit.

There are many causes that bring about egg eating and it may be well to enumerate some of them before my remedy is stated.

Lack of sufficient exercise where fowls are compelled to idle about and perhaps run back and forth over the nests, finally break an egg, eat it and with the delicious taste still with them proceed to eat the rest of the eggs in the nest and devour them as fast as they are laid every day.

Crowded quarters with too many fowls in one pen.

Hens and pullets in the same pen, wrere the hens are cross to the pullets and they seek refuge in the nests, break an egg and the mischief commences.

Fowls that are so fat that they lay soft shelled eggs that are easily broken.

A setting hen that remains on the nest when other hens are laying in the same nest may start the sin, for the combined weight of several fowls is apt to break an egg and the habit is formed.

Fowls that are underfed and half starved pick at anything that looks eatable, break an egg and the deed is done.

The lack of oyster shells or grit is a sufficient cause.

The lack of animal food causes the fowls to crave for something, they know not what, until an egg is eaten and the appetite is formed.

One or several hens or maybe the whole flock will become involved in the habit.

What is the best remedy is the question. I have tried several but this following always proved to be a sure cure:

Take an egg, puncture a hole in one end about the size of a ten cent piece, at the other insert a darning needle. With the lips pressed against the smaller aperture blow out the contents of the egg into a cup. Mix the contents thoroughly with pepper, either black or cayenne, into a doughy mass, and with the aid of a small funnel or spoon put this mixture back into the egg. Seal over the apertures with something that will prevent the mixture from coming out and deposit the egg in the hen house, it matters little whether it is in the nest or in the litter on the floor of the house. The outlaw, or outlaws, will soon find it. A few good mouthfuls of the mixture is sufficient to cure this evil habit for all time. If it fails, every other remedy will fail save the axe remedy, and this should be applied as a last resort.—Successful Farming.

For an article which seems well protected from odor and gases, an egg is extremely sensitive to them. Eggs should be kept in a cool atmosphere; also, when kept longer than a week, should be turned frequently. When an egg rests in one position too long the yolk sinks to the bottom of the shell, the air will work through the pores of the shell, attack the animal matter, and decay sets in. The turning of the eggs has been found the most practical method of avoiding this decay.

EGGS AND THEIR USES.

A Michigan woman who won a prize for writing the best article on eggs succeeded in giving some very interesting information, as will be seen in the following extract:

"The yolk of an egg alone is the better for invalids, and will be frequently relished when the white would be rejected. When cream cannot be procured for coffee, the yolk of a soft boiled egg is a very good substitute.

"To prevent the juice of fruit pies from soaking into the bottom crust, wash the crust over with a beaten egg before putting in the fruit.

"When making frosting in warm weather, set the whites of the eggs on ice for a short time before using. If the eggs you have to use for frosting are not quite as fresh as you could desire, a pinch of salt will make them beat stiffer.

"The white of an egg, an equal quantity of cold water, and pulverized sugar sufficient to make it the required consistency, make a frosting which is very nice, and, as it requires no beating, is very easily made.

"When beaten eggs are to be mixed with hot milk, as in making gravies and custards, dip the hot milk into the beaten egg a spoonful at a time, stirring well each time, until the eggs are well thinned, then add both together; this will prevent the eggs from curdling.

"It is often a question what to do with either the whites or yolks of eggs which are sometimes left over after making a cake frosting and so forth. Either will keep well for a day or two if kept in a very cool place, the yolks well beaten and the whites unbeaten. Whites or yolks of eggs may be used with whole eggs in any cake or other recipe calling for eggs, counting two yolks or two whites as one egg.

"When eggs are cheap or plentiful in summer, wash all those used in cooking before breaking. Save the shells, and when a quantity are dry, crush them where they will dry quickly, and when thoroughly dry put in a thin cotton bag and hang in a very dry place. In the winter, when eggs are scarce and dear, a tablespoonful of this mixture put in a cup, a little cold water poured over it and left to stand over night or for half an hour or so in the morning before breakfast, will answer every purpose of a whole egg in settling coffee.

"Egg stains can easily be removed from silver by rubbing with a wet rag dipped in salt.

"To clean vinegar bottles and cruets, crushed egg shells in a little water are as good as shot, besides being healthier and handier. To mend broken china, use a cement made by stirring plaster of Paris into the white of an egg.

"An egg well beaten and added to a tumbler of milk well sweetened, and two tablespoonfuls of best wine, is excellent for feeble, aged persons who can take little nourishment.

"Eggs are valuable remedies for burns, and may be used in the following ways: The white of the egg simply used is a varnish to exclude the air, or the white beaten for a long time with a tablesponful of fresh lard, till a little water separates, or an excellent remedy is a mixture of the whites of eggs with glycerine, equal parts put in a bottle and cork tightly; shake before using. It will keep for some time in a cool place.

"For inflamed eyes or eyelids, use the white of an egg beaten up to a froth with two tablesponfuls of rose-water. Apply on a fine rag, changing as it grows dry; or stir two drams of powdered alum into the beaten whites of two eggs till a coagulum is formed. Place between the folds of a soft linen rag and apply to the eyes.

"For a boil, take the skin of a boiled egg, moisten it and apply. It will draw off the matter and relieve the soreness in a few hours. To cleanse the hair and promote its growth, rub the yolk of an egg well into the scalp, and rinse out thoroughly with warm water."

ABOUT GEESE.

Best keep goslings out of water until they have a full coat of feathers. Have dry, warm quarters for them at night and keep them confined in the morning until the grass has dried off. The goslings need to be looked after when a heavy shower comes up as they will drown if their backs are allowed to get soaked through. The baby down quickly becomes soaked with water which the young gosling can not shake off.

The old geese do not require any feeding during the summer, but will live on weeds and grass, if they have plenty of water. The only time geese need to be given grain is in winter.

No expensive yards or houses are required for geese. A three-foot wire netting fence will hold them in a yard and an open shed will provide sufficient shelter.

The feathers of geese are an important source of revenue, and always find a ready sale at from 50 to 75 cents a pound. Young geese will be ready to pick when the feathers are what is called ripe. This can be ascertained by examination. At the proper time there will be no blood in the ends of the quills and the feathers will come out easily. When this stage is reached the birds will begin to drop their feathers over the yards. Pick regularly afterwards, about every six weeks. A full grown goose should yield about one pound of feathers in a season. They should not be plucked during the winter.—Successful Farming.

According to a large number of analyses made of domestic eggs at the various agricultural stations, an egg weighing two ounces has the following percentage of composition: Protein, 13.4; water, 73.3; fat, 10.5; and ash, 1. A side of beef contains on an average about the same percentage of protein but a larger percentage of fat. Eggs belong to the nitrogenous group of foods, and would naturally and quite probably be combined in the diet with material supplying carbohydrates (sugar and starch), such as cereals, potatoes, etc.—Coleman's Rural.

The flock should be carefully culled late in the summer or early in the fall, and all useless old hens, surplus cocks and cockerels not wanted for breeding another year, runts and unpromising youngsters, sent to the market, after being thoroughly fattened and finished. The sooner these birds are disposed of the better it will be for the balance of the flock.

"How is it your hens are so prolific?"

"I feed them on layer cake."—Lippincott's.

FARM LANDS FOR SALE.

The Best Bargain Yet—A good, well improved, money making farm of 56 acres, 2½ miles from Arroya Grande, Cal. A prosperous little town—no saloons. Five miles from Pizmo Beach, the finest beach in California. Free rural delivery. The house alone cost $2,000. Good barn and outbuildings. Fine roses. Walnuts and oak trees around house. Assorted berries and fruits. Plenty wood for fuel. Plenty of fine soft water. No irrigation required, consequently no danger of Bermuda grass or other foul weeds. Owner must have the money at once, hence the sacrifice. Price $6,500; $3,000 cash, balance two years, 8 per cent. Also an 80-acre tract of fine, level, loamy land, 50 acres of which is No. 1, in northeastern part of Santa Barbara County. Will grow alfalfa, vegetables, fruits, cotton, etc. No alkali or hardpan. Free timber 1½ miles away. Elevation 2,500 feet. No extremes of heat, cold or storms. Can be irrigated if necessary. $600 takes it. Same owner as above. Wm. T. Mantz, Maricopa, Cal.

Citrus Orchard—56 acres, all under cultivation, 670 lemon trees, full bearing; 716 orange trees, full bearing; 200 lemon trees 2 years old, 250 orange trees 2 years old, 60 Tangerines, full bearing; 2 acres deciduous fruit of all kinds, berries and small fruit. Good house of 13 rooms, finished in hardwood, basement. Barn and other buildings, well and windmill. Well for irrigation costing when completed $1500. Palms and flowers. Lighted with acetylene gas. In fact, it is the best ranch in the valley. Over 2000 shares of water stock. Price $37,000. Terms. F. J. Conrad, The Hustler, West Grand Ave., Escondido, Cal.

For Sale—LINDSAY ORANGE LANDS.

Eleven days before Christmas the fourteen packing-houses of Lindsay sent out pay checks for the 1910 navel orange crop. Lindsay orange district had the holiday orange market all to themselves, and of course they sold at good profit.

Why not invest in some of this Lindsay orange land and get the benefit of rapidly advancing prices?

Ten acre tracts in Lindsay, $150 per acre, on easy terms.

Choice Tulare alfalfa lands, water in abundance; any size tracts, $50 per acre up.

ASBESTOS ROOFING.

The satisfactory result of building construction is dependable to a great degree upon wearing, fire and water-proof qualities and up-keep of roofing. The selection of a roofing which will not be too expensive in price, and yet wear for years without painting or graveling and furnish absolute protection against fire and climatic conditions, has always been a study of considerable moment to engineers and contractors.

That greatest of all asbestos product manufacturing concerns in either America or foreign countries, the H. W. Johns-Manville Co., has the question and problem of asbestos roofing down to a science.

The asbestos used in these roofings is procured in mines owned by the Johns-Manville Co. and the fiber is specially prepared by their own experts and by their own particular process.

"J-M" Asbestos Roofing is designed either for use over boards or concrete. While formerly asbestos roofings were laid with copper flashings, by the "J-M" process the entire roof, including flashings and gutters, can be laid with the asbestos roofing.

THE NEW STYLE WAGON.

The spring bolster wagon, that is advertised on the last page of this issue of The Cultivator is the first really intelligent effort on the part of local manufacturers to meet the demands and the requirements of the California farmer.

The crops and climatic conditions of this coast are so different from what they have in the Eastern states, that they require different tools to handle them, and this is as true of a wagon as it is of many other implements.

For some reasons, the Eastern manufacturers have never recognized this fact, but have continued to sell on this coast the same gear that they sell in their own country.

The firm making this gear has been in the implement business for the past 13 years, and their retail branch—The Woodward Company—is favorably known all over the state.

There is no reason why anyone should hesitate to take their guarantee at its face value—backed, as it is by their big shops, large capital and record for fair dealing. Write for the booklet which describes this gear.

"Yes, Grandma, when I graduate I intend following a literary career—write for money, you know."

"Why, Willie, my dear, you haven't done anything else since you've been at college."

Questions and Answers

THE EDITOR AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper, and sign full name and address. Unsigned communications receive no attention.

White Hogs.

Will white hogs do well in California? Is it advisable to raise stock and sugar beets this winter?—Subscriber.

White hogs are said to be more subject to sunburn and skin diseases that spring from it in hot climates. They certainly have been introduced time and again here in California and disappear before the black hog. It is hardly necessary to repeat these experiments at this day, for in all warm countries the black hog is the one that thrives best. Sugar beets are always good to have to feed, as well as the larger stock beets. A little care will grow the better vegetables. China Sam uses the lengths of the woven lath fences nesting the top edges together in tent fashion, then stands palm leaves against that to protect the delicate vegetable from the frosts. He removes the leaves in the day time. On some he has barley sacks for covers. It requires little protection to keep tomatoes until after Christmas in the garden here. —M. E. S.

Registering Holsteins.

What color markings are necessary for Holsteins? Can an animal with black legs be registered?—Subscriber, Lindsay.

At the last meeting of the Holstein Friesan Association meeting it was decided to bar from registration all animals that were not black and white. Any animal having red or gray or any other color was not to be registered. None having black on legs at the hoofs or broken black spots on the legs below the knees, or animals having black switches to their tails. All white is also barred.—M. E. S.

Bleaching Walnuts.

Kindly give formula for bleaching walnuts.—Subscriber, Pasadena.

The usual method followed in bleaching walnuts is simply use of five per cent solution of salt in water, treated with strong current of electricity which decomposes the salt and releases the chlorine, which in turn acts on the nuts, similarly to the old chloride of lime mixture. This electrical method is said to be the best and is now being used in nearly all the walnut packing houses. The old method employed a solution composed of 6 pounds chloride of lime, 12 pounds sal soda, 50 gallons of water with addition of 1¼ pounds of 50 per cent sulphuric acid added after mixing other components. In this solution nuts are dipped for a minute, then dried and shipped. This latter method has been patented and after extensive law suits the Anderson, Barngrover Company has secured injunction against use of the process without permission.

Fertilizing Walnut Grove.

I want to put lime on my walnut grove this fall and fertilize in the spring before plowing with sulphate of potash and bone meal. Will it be harmful to use lime and then bone meal as above? Which is to be preferred, burnt lime or ground unburnt lime?—Subscriber, Orange.

We do not believe there would be any objection to the plan suggested, though some prefer in place of the bone meal, superphosphate. If lime is applied, it is seldom necessary and we would prefer the ground lime rock unburnt, but if the burnt lime is used, be sure it is thoroughly slaked, for if applied fresh it is too caustic and may injure the soil.

(Continued on Page 406.)

THE ANTI-SMUT CAMPAIGN.

The loss to farmers of the wheat belt in Washington, Idaho and Oregon from smut in the wheat crop of 1911 is estimated by the Chief Grain Inspector of Washington to amount to $7,000,000. This enormous loss has led to the organization of a definite "Anti-Smut Campaign." The leaders in this movement recently met in convention at Pullman to discuss the situation and to plan for a systematic campaign of education, experimentation and organization to eradicate this costly pest. As a result of their deliberations, the following conclusions were reached:

The increased prevalence of smut is due largely to the increase in acreage of fall-sown wheat, as fall-sown grain is more susceptible to the disease than spring-sown, but spring grain is not entirely free from the trouble.

Smut infection comes mostly from smutty seed, but weather and soil conditions influence the amount of infection, and there is a possibility of infection from smut in the ground if very smutty grain has been recently threshed near by.

Solutions for treating seed wheat would be carefully made in certain definite proportions. Some wheat growers have been successful while using haphazard methods, but they are men whose long experience enables them to "guess" very accurately the strength of solutions used. Safety lies in exactly measured strengths.

The strength of vitriol solutions is one pound of vitriol (copper sulphate or "bluestone") to five gallons of water. Wheat should be soaked in this solution for not less than ten nor more than fifteen minutes. Some successful farmers have used as strong as one pound vitriol to two and one-half gallons of water, soaking not more than ten minutes, without serious injury to the wheat. Too strong solution or too long soaking will kill the wheat.

Formalin should be used one pound to forty-five gallons water, the wheat thoroughly wetted by dipping or sprinkling, then covered with wet sacks for two hours, then either seeded at once or allowed to dry thoroughly.

Unbroken smut balls must be removed from seed wheat, as no method of treatment destroys the germs in these balls, and if later broken in the seed wheat they infect the grain.

Experiments by the Washington State Experiment Station at Pullman and by practical farmers will be begun this fall, to determine what solutions are most efficient and what conditions must be guarded against.

Complete eradication of smut by the united effort of every wheat grower is the surest protection against the pest.

Elko, Nevada, has ordered 145 cars to be used in shipping cattle from that point to San Francisco.

Arizona reports shortage of all range cattle.

True To Name TREES

CALIFORNIA ORCHARDISTS

Are reaping handsome fortunes from their investments

There is hardly a man in California today who is not looking eagerly forward to owning an orchard and fulfilling the part of "Living under his own vine and fig tree" and sharing the pleasures and profits which can be derived.

To the Prospective Planter this Year

We wish to call your attention to the great importance of securing

FIRST—Trees which are guaranteed "True to Name."

SECOND—Trees scientifically grown with perfect root systems and free from disease.

THIRD—Trees from a reliable concern, who employ only straightforward methods in their dealings with all patrons.

CALIFORNIA HORTICULTURE
"The Fruit Growers Guide"

It describes 2000 different varieties of trees and plans, is fully illustrated and contains much valuable information to planters. Mailed upon receipt of 25c in stamps.

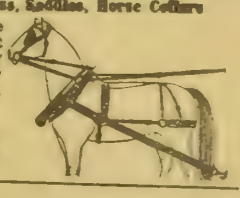
Your dealer has our catalogue



The flame of a powerful blow-torch—which is intense enough to even melt iron—will not burn J-M Asbestos Ready Roofing when held on *one spot* for nearly an hour. Nor will it set fire to boards underneath. This has been proven by impartial tests made by Fire Chiefs and City Council representatives of many large cities.

J-M Asbestos Roofing is absolutely fire-proof because its base consists of several layers of pure Asbestos Felt. And Asbestos, you know, is the fire-proof, practically indestructible, mineral used in gas grates, stove mats, theatre curtains, etc.

These layers of Asbestos (stone) Felt are firmly cemented together with genuine Trinidad Lake Asphalt—that wonderful mineral cement which, in asphalt pavements, stands the grinding of wheels and pounding of hoofs for thirty to forty years.

Thus, J-M Asbestos Roofing is composed of *all minerals*. Not a particle of perishable material in

J-M ASBESTOS ROOFING

Because of this mineral or stone construction, J-M Asbestos Roofing is also rust-proof, rot-proof and acid-proof. And, like all stone, it never needs painting or coating.

No other ready roofing gives a building such absolute fire protection. None other lasts so long with so little attention. J-M Roofing is still in good condition on many buildings after nearly a quarter of a century of service.

Our nearest Branch will supply you with J-M Asbestos Roofing if not obtainable at your dealer's—also apply it, if desired.

SEND FOR THIS ODD STONE

We want to send you a free sample, just as it comes from our mines, of the curious Asbestos Rock of which this roofing is made. We want you to see for yourself that its long, silky, pliable fibres will not burn when held in fire.

Write our nearest Branch now, and we'll also send our handsomely illustrated Book No. J-55

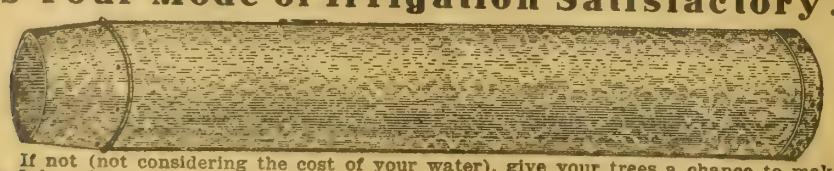
Is Your Mode of Irrigation Satisfactory?



If not (not considering the cost of your water), give your trees a chance to make good by giving your orchard the proper amount of water all over same, and not three-quarters of your water supply within forty feet of your head flume.

The surface irrigating pipe we manufacture will remove this obstacle—will cut your water bill—is more convenient to use and will last a life time.

Write us, stating your requirements and we will cheerfully furnish you with prices and information desired.

We also manufacture Ells, Tees and Gates for this special pipe and are in a position to manufacture any special fittings you may require.

THE AMES IRVIN COMPANY Corner Eighth and Irwin Streets, San Francisco, California

When writing advertisers, mention Cultivator.

Cold or Roup of the Eyes.

Please advise me through the columns of your paper regarding a disease which has appeared among my chickens. The first symptoms, one eye appears weak, and in about a couple of days it inflames and swells and completely closes the eye. It never has affected both eyes. We have never found any mites or lice, and have examined them carefully. They do not lose their appetites.

Can you advise me as to the cause and remedy?—Subscriber, Orange.

Your chickens are taking cold, either from lice or from a small draught through a crack or knothole just on the level of their perch. Go down on your knees and put your head on a level with the perch, and you will be sure to find it. I know from personal experience. The boards on one house dried and cracks came after a hot summer, and a whole perchful of chickens got cold. As soon as I found it out a few laths nailed up stopped the trouble. Stop up cracks and knotholes, and wash the eyes and head with a solution of Germozone or with a weak solution of blue stone, and give bluestone or Germozone in the drinking water. A bit of bluestone the size of a navy bean in a quart of water for bathing the eye and for drinking.

There is a possibility that it may be roup of the eyes, in which case the above treatment is the best I know. Greasing the head and eyes with carbolated vaseline is also a good remedy.—Mrs. A. B.

Reproducing by Cuttings.

Will suckers from quince and fig trees prove desirable?—Subscriber, Nordhoff.

The fig is one of the easiest fruit trees to reproduce by cuttings, the quince less so, but with care good trees may be had. As to suckers there is a difference of opinion, but we believe that you can get first-class trees from sucker wood.

Gathering Peaches.

Referring to the remarks of Mr. Cox on Page 317 of the Cultivator, the thought occurs to me that you can aid us greatly by giving full directions as to best method of gathering peaches. They so easily bruise and decay when not most carefully handled.—Reader, Whittier.

The reader's suggestion is a most excellent one, but too late for this season. The gathering of peaches does not seem to have been made a feature of books on fruit culture and we suppose it is deemed merely a matter of best of care in handling fruit that has not yet reached the soft stage.

Dehorning Goats.

How close to the head should goats' horns be cut? I have goats one to five years old that I wish to dehorn. Is it necessary to give any treatment to the wound after the sawing? We consider the California Cultivator the best farm journal we have ever taken. Subscriber.

We have had no experience with dehorning goats. With cattle it is usually done by cutting slightly under the skin. This gives a chance to heal over and the cow takes on more of the perfect muley appearance. Where stubs are left the animal is still able to do some damage as they will grow longer. If dehorning is done in cool weather when flies are not a pest the wound is usually left without treatment; during fly season a coating of tar or other repellent may be used. We assume that two or three-day-old kids may be dehorned or have horn growth prevented the same as cattle by use of caustic stick.

Grinding Machine.

What are the mechanical reasons why low-priced machines can not be obtained for grinding alfalfa meal? Is there any loss of nutrient value when alfalfa is dried so that it readily powders in the hands? By nutrient value I mean power to produce tissue as distinguished from palatability. Is there sufficient nutrient in bean straw to justify grinding for hogs?—Subscriber, Jamacha.

We know of no reason why a low-priced machine may not be had for grinding alfalfa meal should the manufacturers see the demand for such a machine. Personally, we would not see the advantage of such grinding. The most desirable portion of alfalfa hay is the leaves. While grinding makes stems and all more readily available for digestion, once in the animal's stomach, we question whether there is sufficient gain to pay for the labor of grinding. For poultry, of course, it is most desirable. We believe there is no loss in the nutrient value of alfalfa by drying or grinding; neither is there any increase. Bean straw is a valuable food, but we have never heard of any advantage in grinding it. Ordinary field bean straw analyzes 3.6 per cent crude protein, while alfalfa hay should run over 11 per cent.

Wormy Fruit.

We take and carefully preserve every issue of the Cultivator, but would like to ask one question which we have not seen answered, and that is, how to prevent dried fruit from becoming wormy, especially for home use.—Subscriber, Chino.

If the fruit is taken from the trays in the middle of a hot day and kept in the dark or where the moths will not get to it, it is reasonably sure to be free of the insect pests. If, however, it is found that the eggs have been deposited and worms are showing up it would be well to dip in boiling water for several seconds or even a minute, then expose to the sun in the middle of the day to take off the surplus moisture. Be sure and take up while the sun is still hot, and pack away, covering with papers if necessary to prevent access of other insects. In small quantities for home use we have seen two-quart fruit jars used, but placing in paper sacks is usually sufficient. It is possible that where large quantities are lying fairly loose in a bin and the room can be tightly closed the use of bisulphide of carbon will destroy any animal life.

Breed of Stock.

Please tell me what is the best kind of cow for dairy use, also best work horse for farm.—Subscriber, Tulare.

The best dairy cow is the one in which you will take the greatest pleasure and will best fit your conditions. We have heard of enthusiasts testing different breeds of dairy cows or other animals side by side with excellent results for one breed, while a neighbor has directly opposite experience. Any of the greater dairy breeds like the Jersey, Guernsey, Holstein, Ayrshire, and possibly some others, will give excellent returns if handled with intelligence. It is a question of breeder as well as breed. The same applies to work horses. Will the farmer have his light driving horse or auto for road use and will the work horses have only the farm work to do? In such a case the heavy draft type is to be preferred. If a combination animal is wanted then a lighter breed should be selected. If the draft animal is chosen, it may be Percheron, Belgian, Clyde or Shire. The favorite in this state, if greater numbers indicate, is the Percheron.

General Agriculture

CO-OPERATION IN FRANCE.

In the departments of Provence and Languedoc where the cultivation is varied and there is a large quantity of early produce grown, a fruitful co-operative movement has been developing of late years. Under the authoritative guidance of the Union of Agricultural Syndicates of the Alps and of Provence, which comprises 250 syndicates and 250,000 members numerous societies have arisen side by side with the co-operative wine vaults, oil works and dairies, for the sale and carriage of fruit, vegetables, etc.

The Bulletin of Economic and Social Intelligence, published by the International Institute of Agriculture, gives an interesting account of these various forms of co-operative association in the June number. We may mention first of all the syndicates of Cuges, Lascours, Rocquevaire, which concern themselves with the sale of pickles, in the last mentioned place the society has also started the manufacture of apricot jam, and is doing business to the amount of 400,000 frs. a year.

The agricultural syndicate of Vallauris has organized the distillation and sale of orange flowers; it has 1700 members, and has an establishment at Golfe Juan which cost 200,000 frs. to set up. Thanks to its exertions, producers have seen the price of orange flowers rise from 0.30 frs. to 1.10 and 2 frs. the kilogram.

For some time past the co-operative exportation of table grapes has been attempted with equal success. At Cabrieres-d'Aigues (Vaucluse) the growers of these grapes have joined together in a society with a capital of 2000 frs. and have obtained a loan from the state fund for agricultural co-operative credit of 400 frs. The grapes are packed in baskets holding 10 kg., and are sent for the most part to the markets of Cologne and Geneva. In 1909 there were 350 quintals of grapes exported at the net price of 18 frs., and in 1910 the quantity was 250 quintals, the price being 45 frs. per quintal.

Another interesting form of association has been started with success in this region; that for the carriage in common of fruit and vegetables, which is likely to put the growers in a position to take advantage of the reduced tariffs granted for the expedition of complete wagon loads. There are already five societies of this kind in the Gard and Vaucluse.

We may mention, for example, the Syndicate of Rochefort-du-Gard, which confines itself to collecting together, at the station near the hills, the tomatoes already packed by the members, and sending them to the Paris markets. The consignment is made to a transport agency of the Capital which delivers the goods at their destination, collecting the sums indicated in the various invoices for the account of the syndicate.

This system has reduced the carriage expenses to the half, and has been the means of lengthening the season for the expedition of tomatoes by three months. In 1910 the syndicate sent off more than 1000 tons of produce, the railway expenses for which were 60,000 frs. and those for the camionnage in Paris about 8700 frs.

The neighboring syndicates adopted the same measures for the consignment of cauliflowers, potatoes, etc., which are sent to England and Switzerland.

A new association which has arisen at Carpentras for the sale of grafted vines which have been grown by the members, is worthy of mention. The Nurserymen's Co-operative Society of Vaucluse has a capital of 7500 frs. at the present day and 2000 members who have 60 hectares of land out in nurseries. In 1910 about 18,000,000 wild vines were planted, the total expenditure being 300,000 frs. and 5,500,000 plants of first quality were sold for 550,000 frs. The society supplies its members with manure and vine slips and pays each member 60 frs. on account for every thousand vines delivered. Within a very short time it has succeeded in regulating and improving the trade in these products, which is daily acquiring greater importance in connection with the reconstruction of vineyards in France and Algiers.

BUYING THE AUTO.

Picking out the right car is not the task it was once, there are many good cars now and there is less possibility of going wrong. Styles of body and design of motor and the mechanical features have become standard.

So the four-cylinder, shaft-driven car is today by far the most popular and I believe it is justly so. I have owned many different types of cars and have driven many more, all the way up and down the line from the one to the six cylinder, and the four seems to be the happy medium.

Of course, in the lighter cars and runabouts one has the satisfaction of simplicity in the one and two cylinder cars and I would much rather have a good single-cylinder than a cheaply constructed four.

Choosing the best car for one's needs, however, is not so easy.

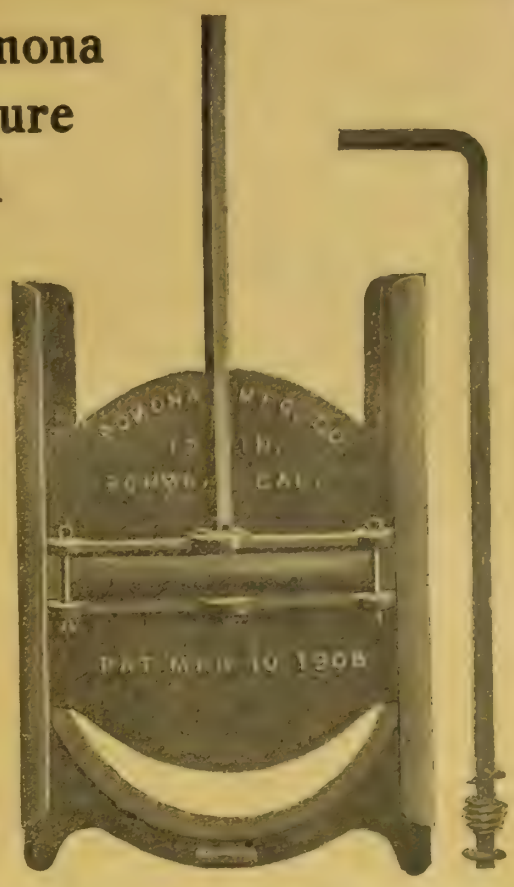
If I were buying a new car I would go about it in this way. First, I would write and get the catalogues and printed matter of every automobile maker who advertised extensively—I put in this last clause because it is a fact that there is not a good car of careful manufacture on the American market which is not thoroughly advertised—when I had received the catalogues I would spend many a pleasant evening going over the details and learning the details which go to make one car superior over the other.

I would look carefully to a few things, for instance, the steering gear and spindles, the width of brakes and strength, the number of bearings in the motor, the transmission, etc., then I would compare the factories and find out if the car of my choice had had the "right bringing up."

Of course, you know what style of car is best suited to your needs, and whether you would prefer the five or four passenger body or the light runabout style for two. You can afford to give this matter some serious consideration, as I have had several friends who bought runabouts when they should have had a touring car and four passenger cars when they carried two all of the time.

There is no need of arguing as to the practicability of the automobile on the farm any more; we have proven that

Give the Pomona Patent Pressure Gate a Trial



No rubber or wooden facing to rot or wear out. Absolutely water tight when closed. Locking mechanism is protected against rust or clogging with sand or dirt. Simple in construction. Cheap in price and as durable as solid iron.

THE LOCKING DEVICE is the simplest made, merely a tapering screw with split tapering nut socket. It locks the cover in any desired position or locks the faces, making an ABSOLUTELY WATER TIGHT JOINT.

TWO FOOT HANDLE FURNISHED WITH EVERY PRESSURE GATE FREE.

ALSO A FULL LINE OF CIRCULAR VALVES FOR ORCHARD AND ALFALFA IRRIGATION CARRIED IN STOCK.

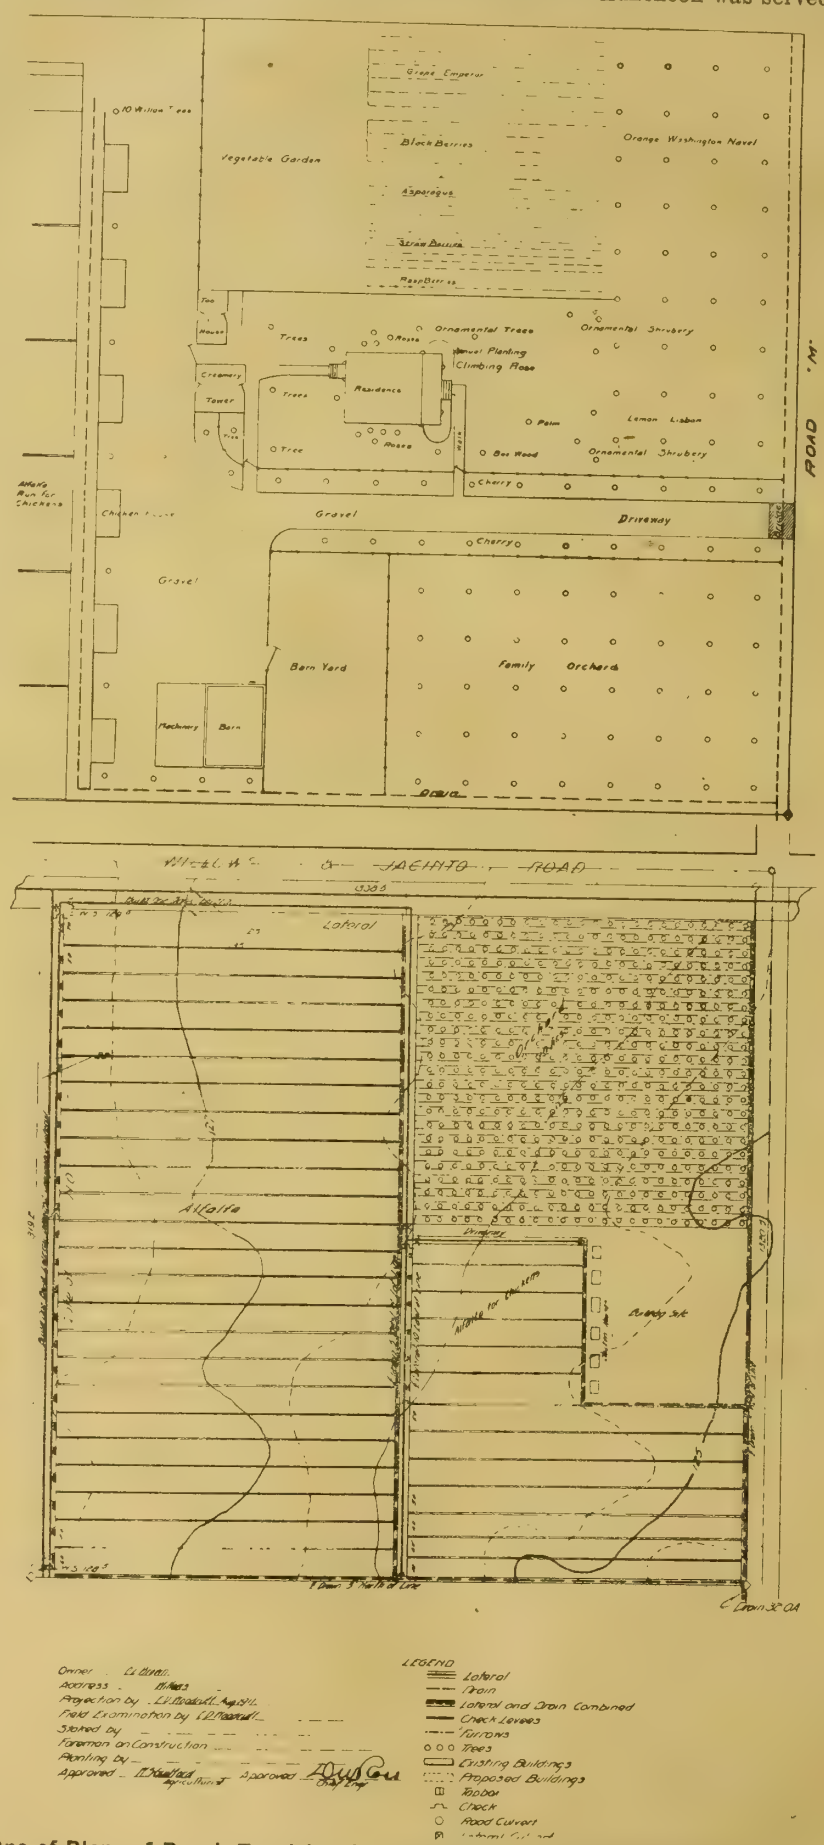
CONSERVING ENTHUSIASM.

(Continued from Page 385.)

tendent of the Arlington Heights Fruit Company of Riverside, and of course two of the best drivers at the wheel.

Seeing the Farms.

The day was typical of California and an early start was made. The first bunch of ranches judged was made up of new places started within the last year in a section southeast of Willows in Glenn County, some five or six miles. The principal crop grown on these places is Egyptian corn, which answers for poultry, hogs and cows and makes a good start in getting the land in better condition for alfalfa. Each of the places showed some preparation for alfalfa and the prize winning first year orchard work was in this section. From here the machines took us ten miles to the north, judging nearly a dozen ranches on the way. This was north of the town of Jacinto on the banks of the Sacramento river in Glenn County. The most interesting feature of this ride was the experience in driving along the levees of the "river of romance." Luncheon was served at one of the ranch houses of the company known as the Schadd ranch. After luncheon the remainder of the places were visited and the scores counted up, showing the following winners:



One of Plans of Ranch Furnished by Agricultural Department of Sacramento Valley Irrigation Company. The Lower Plan Shows General Plan of Ranch With Engineer's Contours. The Upper Shows Detail of Building Site, Marking Location for Ornamentals, Small Fruits, Etc.

Prize Winners.

Best general farm, G. N. Davis of Princeton, Colusa county; second, L. L. Grieve, Princeton; third, E. E. Wood, Princeton.

In the first year development of farm Mr. S. C. Davis of Glenn was given first place and Mr. R. H. Russell of Willows, second. First year orchard, John Suchy of Willows won first, and C. Schuler of Willows, second. For the first stand of alfalfa Wm. Hubbard of Princeton was given first prize, and J. F. Windell of Glenn, second. For best preparation for alfalfa, L. J. Lowery of Willows took first and R. G. Jesse of Glenn, second. Mr. G. N. Davis of Princeton, winner of the first general farm prize, was in last year's contest and his farm was then fully considered by the judges, but through not being so productive as others was not granted a prize.

The best first year of development by Mr. S. C. Davis was a proof that the back to the farm movement is accomplishing some good. Mr. Davis was formerly a minister and entered upon his ranch experience with most limited knowledge of farm life. He was just beginning his work when the judging of last year's contest was taken up and afforded an excellent opportunity to the judges to see one year's work as done by a man not especially strong of muscle, but with a will to do things. Mr. Davis has done his year's work with but little money outside of the production of his own place. He has grown Egyptian corn, melons and garden truck of practically all kinds and has started a number of fruit trees. Cows, pigs and poultry enter into the ranch scheme and all have aided in supplying the house with necessities and even some luxuries during this first year. The Jersey heifer which Mr. Davis won will add to the worth of the bunch of cows he now has.

The prize for first year orchard trees, which went to Mr. Suchy, was well deserved. These trees showed a wonderful growth. Only one or two vacant spaces in the orchard showed the percentage of stand to be excellent.

Mr. Hubbard, winner of first prize for best stand of alfalfa, was entered in no other class, but he certainly understands growing of alfalfa and has a most excellent showing.

Mr. Lowery, winner of first prize for first year preparation for alfalfa, had his ditches provided with gates, dikes, well constructed and compact, and his ground in generally the best condition of any of the contestants. He is one of the newer comers to the valley and his place bears the marks of being handled by one thoroughly competent to make the winning of more prizes than his 100 pounds of alfalfa seed.

The plan of judging was for the best general farm, and best first year development to give to improvements 25 points; irrigation system, that is, arrangement of head ditches and flumes, 25 points; production and crop yield, 25 points; neatness and arrangement of place, 15 points; and productions or diversity of general farm crops, 10 points. If improvements were perfect it was granted the full 25 points; if not, from that number was taken enough points to meet the conditions which the ranch showed.

The other contestants were: Frank Lawrence, C. F. Warriner, C. B. Henry, T. S. Henry, B. Maitner, F. E. Tyson, R. W. Smith, P. J. Cook, V. E. Breese, M. D. Adams, T. T. Smith, R. C. Jesse, J. W. Jesse, J. C. Grussener, C. Parella, J. E. Combs, Wm. Rosebrock, J. R. Adams, W. P. Watkins and W. H. McCauslan.

Household Department

HALLOWE'EN.

Bring forth the raisins and the nuts—
Tonight All-Hallowe'en Spectre struts
  Along the moonlit way.
No time is this for tear or sob,
Or other woes our joys to rob,
But time for Pippin and for Bob,
  And Jack-o'-Lantern gay.

Come forth, ye lass and trousered kid,
From prisoned Mischief raise the lid,
  And lift it good and high.
Leave grave old Wisdom in the lurch,
Set Folly on a lofty perch,
Nor fear the awesome rod of birch
  When dawn illumes the sky.

The air resounds with tuneful notes
From myriads of straining throats,
  All hailing Folly Queen;
So join the swelling choral throng,
Forget your sorrow and your wrong,
In one glad hour of joyous song
  To honor Hallowe'en!
—John Kendrick Bangs, in Harper's Weekly.

ON THE WEDDING MORN.

Scene—A high noon wedding at home.

Characters—Mr. and Mrs. Also Present.

He—"Awful bore, this wedding business, isn't it?"

She—"Quite the contrary. I think it delightful."

He—"H'm—Do you think the decorations are pretty?"

She—"Not at all. They are evidently of home manufacture."

He—"Oh, there's Rose Passee and Algy Mainspring. He looks as bored as I feel."

She—"Yes, men are so coarse. It always takes something gross to interest them. Rose is flirting desperately, as usual. Beginning to show her age, too, isn't she?"

He—"Oh, I don't knod. I think her a stunner."

Seh—"That's the way with you men. You never see below the powder."

He—"Sometimes it covers a multitude of sins. Now, in your own case——"

She—"Brute! Sh-sh—Here they come. I can't see anything but the wretched fit of her gown and the tip end of the groom's nose."

He—"I can't see anything but ten waving, wabbling, willow plumes on ten skyscraper hats. If you women ——"

She—"Sh! They're beginning——"

He—"More's the pity. Some day he'll wish they had never begun. What's the good of coming? A man's a fool to let his wife——"

She—"Sh—sh!"

He—"What does the groom look like, anyhow?"

She—"The tip end of his nose is lovely."

He—"That's like you women. Never see further than the end of a man's nose."

She—"I've seen beyond that in your case, and found nothing to pay for the investigation, merely an empty vacuum. How silly it is to sing 'For All Eternity' at weddings in this trial marriage age."

He—"Is it over? I'm deuced glad of it. Now let's go home."

She—"By no means. We must congratulate them."

He—"On what? Oh, piffle——"

She (to Bride)—"Dear Alice, a thousand good wishes, I'm sure. A lovely wedding, and such a perfect gown, and as for the decorations, they're simply perfect!"

He (to Bride)—"Congratulations! Best wishes! Everything ripping!—oh, no, not that—merely slang for lovely, great and other adjectives, you know!"

She (to Groom)—You're the envy of all the men. Alice is such a nice girl, even if she isn't pretty. But then——"

He (to Groom)—"Congratulations, old top. Hope you won't regret it, don't you know. Know you'll be glad when it's all over, won't you?"

She (in the library, where the gifts are displayed)—"Same old things. Well, I declare! If there isn't that ice bowl I gave Blanche Sterling at Christmas! How she does pass things along!"

He—"Where's ours?"

She—"'Way over in the corner by the door, where nobody will see it. I'm glad I forgot to take off the price tag after I marked it up. I hope she won't try to exchange it for something of the value I've put on it. That would be just like her, however."

He—"They're serving champagne punch. Do let's get into the crowd."

She—"Of course. But don't look so eager. People will think we never have champagne."

He—"Well, do we? Hurry up, can't you?"

She—"Sh! Do act as if it didn't matter. (To waiter) Yes, just a sip. Only a small piece of cake. Thanks."

He—"Great, isn't it? Another? Yes, I don't care if I do."

She (aside)—"You're behaving disgracefully."

He—"I don't care. A fellow must have some reward for sissying around these places. Yes, you may fill it up again. No cake, thanks."

She—"We must go at once. I'm mortified to death. What will people think? And just as we are getting a social foothold, too. (To hostess) Oh, good-bye, Mrs. Matchmayker; everything was charming. We've enjoyed it so much. I hope Alice's marriage will be as happy as ours. Mr. Present and I never disagree in the slightest particular."

He—"Good-bye, er—Oh, I've left my cane—just wait a moment."

She (after a five-minute interval of waiting)—"I knew I would find you at the punch bowl again! You wretch! I remembered after you had gone that you hadn't brought a cane. Now come at once!"

He—"Hooray! Weddings are great things, my dear. I'm drinking toasts, and I'm just getting warmed up——"

She—"Well, if warming up is what you want, just come along——."—Sunday Magazine.

One ship drives east, and another west,
With the self-same winds that blow;
'Tis the set of the sails,
And not the gales,
Which decides the way to go.
Like the winds of the sea are the ways of fate,
As we voyage along through life;
'Tis the will of the soul
That decides its goal,
And not the calm or the strife.

It is not what stays in our memories, but what has passed into our characters, that is the possession of our lives.

This Washer Must Pay for Itself.

A MAN tried to sell me a horse once. He said it was a fine horse and had nothing the matter with it. I wanted a fine horse. But, I didn't know anything about horses much. And I didn't know the man very well either.

So I told him I wanted to try the horse for a month. He said: "All right, but pay me first, and I'll give you back your money if the horse isn't all right."

Well, I didn't like that. I was afraid the horse wasn't "all right" and that I might have to whistle for my money if I once parted with it. So I didn't buy the horse, although I wanted it badly. Now this set me thinking.

You see, I make Washing Machines—the "1900 Gravity" Washer.

And I said to myself, lots of people may think about my Washing Machine as I thought about the horse, and about the man who owned it.

But I'd never know, because they wouldn't write and tell me. You see, I sell my Washing Machines by mail. I have sold over half a million that way.

So, thought I, it is only fair enough to let people try my Washing Machines for a month, before they pay for them, just as I wanted to try the horse.

Now, I know what our "1900 Gravity" Washer will do. I know it will wash the clothes, without wearing or tearing them, in less than half the time they can be washed by hand or by any other machine. I know it will wash a tub full of very dirty clothes in Six minutes. I know no other machine ever invented can do that, without wearing out the clothes.

Our "1900 Gravity" Washer does the work so easy that a child can run it almost as well as a strong woman, and it don't wear the clothes, fray the edges nor break buttons the way all other machines do.

It just drives the soapy water clear through the fibres of the clothes like a force pump might.

So, said I to myself, I will do with my "1900 Gravity" Washer what I wanted the man to do with the horse. Only I won't wait for people to ask me. I'll offer first, and I'll make good the offer every time.

Let me send you a "1900 Gravity" Washer on a month's free trial. I'll pay the freight out of my own pocket, and if you don't want the machine after you've used it a month, I'll take it back and pay the freight too. Surely that is fair enough, isn't it?

Doesn't it prove that the "1900 Gravity" Washer must be all that I say it is?

And you can pay me out of what it saves for you. It will save its whole cost in a few months, in wear and tear on the clothes alone. And then it will save 50 cents to 75 cents a week over that in washwoman's wages. If you keep the machine after the month's trial, I'll let you pay for it out of what it saves you. If it saves you 60 cents a week, send me 50 cents a week till paid for. I'll take that cheerfully, and I'll wait for my money until the machine itself earns the balance.

Drop me a line today, and let me send you a book about the "1900 Gravity" Washer that washes clothes in 6 minutes.

Address me this way—H. L. Barker, 368 Court Street, Binghamton, N. Y. If you live in Canada, address 1900 Washer Co., 357 Yonge Street, Toronto, Ont.

Sandow Pumps 4000 -Gallons a Minute!-

For Drainage, Irrigation, Dry Docks, Excavations, Coffer Dams and all places where large volumes of water must be moved, the SANDOW engine and direct connected centrifugal pump is a perfect proposition. REAL FUN FOR HALLOWE'EN.

Every boy feels that he has a special right on Hallowe'en night to go out and have some fun. Somehow or other the fun is very apt to be at the expense of other people. It may seem very amusing to take gates off their hinges and hide them; but this is cruel fun, for it makes work for the older people who have to put them back again.

Ringing doorbells is another standing joke that may turn out badly. Some boys once stood a board up against a front door, rang the bell and ran across the street to see what would happen. A woman came to that door with a lighted lamp in her hand, and the board fell against her, smashing the lamp, and setting her on fire, so that she was terribly burned.

There are plenty of ways of having fun without injuring anybody, and a good plan is to get up a hallowe'en masquerade party. Let every boy hunt up the queerest old clothes he can find and dress in them, so that the others will not know him. If he has not a mask he can rub his face with burnt cork, or paint himself to look like an Indian, doing anything that will make it hard for the other boys to recognize him.—The Delineator for October.

PRETTY HALLOWE'EN TABLE FANCIES.

A particularly pretty table fancy was shown at an informal evening party where the supper was "en buffet." Lighted jack-o'-lanterns were placed on the sideboard and a large weirdly-shaped Japanese lantern hung directly over the dining room table. The table was round and was covered with a bright yellow cloth. Two large brass platters were placed at one end of the table with a proper distance between them to give them the effect of being big round eyes. A large round cake iced with pistachio frosting filled the center of each platter while a rim of small white cakes outlined them prettily. The "nose" was another round dish filled with little round nut sandwiches and the "mouth" was a half moon of small round brass dishes filled with fruits, bonbons, nuts and so forth.

Each feature was outlined by bitter-sweet vine and the effect was as novel as it was charming. Having the features not too close looked best. A pretty table for Hallowe'en or for any autumnal party can be planned by having the tabel bare with big doilies cut from scarlet material in the shape of maple leaves. For a centerpiece a dish or bowl of highly polished fruits looked most dainty, draped with the airy clematis. If for Hallowe'en a bare branch can rise from the center of the fruits on which can be perched two or three saucy looking paper owls.

Strings of small red apples and gilded nuts can depend from the chandelier, while loops of popcorn rubbed with phosphorus are effective when the only light is shed from jack-o'-lanterns.

Little crook-neck squashes, hollowed out, make delightful little horns of plenty to fill with bonbons or candied fruits, while apples and oddly-shaped potatoes will serve nicely for candlesticks, having the candles colored red, green or yellow.

TO RENOVATE BRONZE-WORK.

Mix 1 part muriatic acid and 2 parts water. Remove all grease and dust, and apply with a cloth. When dry polish with sweet oil.

THE HALLOWE'EN FEAST.

Wisdom Cakes.

Select good-sized dates and with icing mark the features of the owl on each, cutting the ears into the dates. Press these into fresh icing placed on oblong molasses cakes and put citron on to represent branches; then form feet with chocolate icing.

Hobgoblin Cups.

Serve frozen cider sherbet in the hobgoblin cups which are made of papier mache and come expressly for this purpose. Each cup bears a different expression, and green paper pumpkin leaves also can be purchased on which to serve them. If the cider is sweet then enough lemon juice should be added to give zest to the ice. When the ice is frozen to a mush add one cupful of sweet cream to each quart of cider and finish freezing.

Ghost Apples.

Large, perfect apples are cored and baked until soft, but not long enough to burst the skins. These are cooled and served singly to each person, together with a marshmallow, three cubes of sugar and a liquor glass of brandy. The marshmalowls are pushed down into the bottom of the cavities left by the removal of the cores and the remaining space filled with the cubes of sugar. Upon these the brandy is poured and then lighted. It burns with a ghostly blue flame until the alcohol is consumed and the sugar melted. The apples are then eaten with cream.

BY REQUEST.

The state library has recently had the privilege of checking the census list of the blind in California. It was found that, although over four hundred blind people were enrolled as borrowers from the state library for the blind—and this is the greatest number of borrowers in any state in the Union—there are still between eight and nine hundred blind not borrowing. It is the desire and aim of the state library to reach these hundreds of people, and anyone who knows a blind person is asked to tell him or her that embossed books in five different types are loaned free of all cost to any blind in the state, simply on application. It has been found that almost any one who does not already know how to read raised types can learn with an alphabet and primer borrowed from the library. A letter of request for information or books will receive an immediate response. Address the State Library, Sacramento.

HOW TO FIGHT ANTS.

Of all the insect pests which trouble the housekeeper there are none that are so difficult to deal with as ants. To understand the difficulty of exterminating either the black or red ant, one must know something of their habits. Here is a brief outline which will aid the housekeeper in carrying out a successful plan for the extermination of these pests: Ants live in colonies, and are divided into males, females and neuters. The neuters do the work. The males and females rarely leave the colony. The swarms of ants that appear in the house are composed of neuters. The destruction of these ants will lessen the nuisance, but the insects cannot be exterminated in this manner, for others to replace them will be produced in the colony. The colony or nest must be found, and the males and females destroyed. This is a difficult matter,

and it is only by patient watching that one is able to follow the ants to their home. The colony may be in the soil outside the house, in which case it is easily found; or it may be in the walls or under the floors of the house, where it is more difficult to reach them.

To exterminate ants, trace them to their home. To do this, it may be necessary to remove part of a floor or the baseboard of a room. Wherever the nest is found, such measures must be taken as shall kill all life in it. If the nest is in the house, saturate it with keresene oil or with boiling water. If the nest is in the ground, have a long, sharp pointed stick, which press into the nest, remove quickly, and pour about two ounces of bisulphide of carbon into the hole; close at once by pressing the foot on the hole. Proceed in this manner until six holes are made, filled and closed. The fumes of the bisulphide of carbon will penetrate to every part of the nest, destroying all life. Be careful not to breathe the fumes of the chemical, and be very careful not to have light or fire near when using it. A lighted candle, cigar or pipe might cause an explosion.

Ants may be trapped in either of the following two ways: Cover plates with a thin coat of lard, and set them in the places infested by the insects. Place little sticks at the side on which they can mount to the plates. When the plates are full, drop them into a pan of hot water. Or wet sponges with sweetened water and place them about. When full of the insects, drop into hot water. A poison called ant sugar, which may be obtained from any drug store, will also be found effective.

Strong odors will sometimes drive away these pests, but as a rule one does not want to use such odors where there is food. Among the odors that may be used are oil of pennyroyal, oil of cedar (a few drops put on bits of cotton, which are then placed in the infested places), or gum camphor.

To protect food, keep it as much as possible in closely covered tin boxes, or in the refrigerator, or on tables which are protected by having the legs placed in four dishes, in each of which there has been poured some tar water, to the depth of about four inches.—Country Gentleman.

First Year Work of Girls at San Luis Obispo State Polytechnic School.

HOMELY HINTS.

To scald tomatoes easily, place them in a thin bag and dip in boiling water.

Chopped preserved ginger added to the sauce served with cottage pudding is a delicious accompaniment.

To give a very delicate scent, place a large piece of orris root in the water in which lingerie is washed.

To keep salt meat from molding, rub every fortnight with white of egg in which has been mixed a little salt.

A pallette knife is a great help in the kitchen for cleaning cake dough from the mixing bowl and for many other uses.

To get the best results from dried fruits, put to soak in warm water to which a generous pinch of salt has been added.

To clean and tighten cane seats, soak them well in hot water and use soap if it is needed. Then dry in the open air.

A tasty desert is made of squash or pumpkin prepared as for a pie. It is baked in a pudding dish like a baked custard.

If the cellar is dark, it is a good plan to have the bottom step painted white, so that it can be seen in the dim light.

A little molasses put on the roosting place of the sparrows when they become a nuisance over the windows will drive them to other quarters.

THREE EGGLESS RECIPES.

Pumpkin Pie.

Allow one cup of cooked pumpkin for each pie, half cup of brown sugar, one tablespoon of flour or teaspoon of cornstarch, one scant cup of sweet cream, one-fourth teaspoon of baking powder, and the same amount of spice or cinnamon. Beat well, bake with one crust.

Corn Bread.

Mix one scant teaspoon of soda and one of salt and just a pinch of sugar with three pints of sifted meal. Stir in milk until a rather soft batter is formed; beat until light, pour in a shallow pan, hot and well greased. Bake in a quick oven.

A Good Fruit Cake.

Cream together one cup of sugar and half cup of butter. Add one cup of sour milk, one teaspoon of mixed spices, one level teaspoon of soda and two cups of flour, and one cup of chopped raisins rolled in flour. Bake in a loaf.

"We are always in these days endeavoring to separate intellect and manual labor; we want one man to be always thinking and another to be always working, and we call one a gentleman and the other an operative; whereas, the workman ought often to be thinking, and the thinker often to be working, and both should be gentlemen in the best sense. As it is, we make both ungentle, the one envying, the other despising his brother, and the mass of society is made up of morbid thinkers and miserable workers!"—John Ruskin.

"A good action does not make a sinner into a saint any more than a leap into the air makes a fish into a bird."

Hay.

We quote the wholesale prices in round lots on today's market as follows, viz.:

Scott, Magner & Miller say:

Arrivals of hay on the San Francisco market for the week ending today have amounted to 2,700 tons. This quantity is just about the same as we received during the previous week. The larger proportion of this amount consisted of alfalfa and low grades of grain hay, coming in by water from the bay and river landings, and did not in any way affect the market on grain hay coming in by railroad. Comparatively very little arrived by car from our better districts, although there are still a few lots coming in out of the fields.

Orders on shipping trade are being filled regularly, but in small quantities only, and there has been no inquiry for large amounts for export purposes recently.

The conditions in the alfalfa market have remained just about as they have been during the last few weeks. The weather has continued to be most advantageous for harvesting the late cuttings of alfalfa, which tends to considerably increase the output of this article for the season. A great deal of this hay is moving forward steadily and going into consumption and storage for later use. Prices are practically unchanged and trade very good. Our arrivals of alfalfa hay are coming in exclusively from the river districts.

Cream Separators, all sizes and prices. O. J. Weber Co., 225-227-229-231 East Sixth Street, Los Angeles.

Deciduous Fruit Market

F. B. McKevitt, general manager of the California Fruit Distributors, reports:

Sacramento, Oct. 21, 1911.

The following gives the number of cars of deciduous fruit shipped from all points in California for the week (7 days) ending Friday morning, Oct. 20th:

Peaches and plums will no longer be quoted, although belated reports would indicate that there are still a few of them moving. These cars will show up in the final report for the season, but as they have no place at this time, shipments will no longer be noted in these letters.

Pears, 32¼ cars. Movement of this fruit continues rather larger than expected. The shipment, however, is nearing its conclusion, and probably will not last more than another week.

Grapes, 567 cars. As indicated last week the grape movement is nearly stationary. It is probable that next week about the same quantity will go forward as during the past seven days. Tokays are nearing their conclusion; another ten days will see the crop practically all moved. Cornichons are offering in increased volume. Emperors are ready to pick, and will be shipped as soon as Tokays are out of the way. All grapes are of fine quality. Markets have improved generally, and there is a better feeling all around.

Weather continues fine.

Comparative statement of shipments up to Oct. 13th, 1911:

	1910	1911
Cherries	250½	215¼
Apricots	289¾	214½
Peaches	2517¾	2018½
Plums	1552½	1365¾
Pears	2354	2271¾
Grapes	3993½	4206¼
Sundry	15	13
Total	10,973	10,306

Citrus Fruit Market

LOS ANGELES, Oct. 25, 1911.

With auction markets taking Valencias at from $4 to $6 per box, the orange grower has no particular complaint, but the country over the condition is hardly as strong as last week. This is due in part to the receipts of Porto Rican and Florida fruit. That fruit is coming in in fairly good condition, and there has been only one confiscation of green fruit. This was in New York on a shipment from Porto Rico. There are probably not over 100 cars of California Valencias as yet to go. Reports from northern and central sections indicate earliest Navel shipments will begin going forward about November 1 or about the time the Valencia shipments cease.

Lemon shipments continue fairly liberal and at satisfactory prices. The big prices which obtained last year may not be secured, but the general condition is satisfactory.

Shipments.

Shipments of oranges to date since November 1, 1910, 36,725 cars; lemons, 6,667; total, 43,392. To same date last season: Oranges, 25,236 cars; lemons, 4,714; total, 29,950.

NEW YORK, Oct 23.—Ten cars Valencia, two cars lemons sold. Market strong on small sizes Valencias, easier on large sizes; lower on lemons. Weather fair.

Spring Bolster Wagon

Sold under the broadest guarantee ever given with any wagon.

Ask Your Dealer to Show It to You or Write for Booklet Describing It Fully

Patents Pending

QUALITY and IMPROVED CONSTRUCTION and PRICE—that's what we offer in our gear—that's why we sell them faster than they can be built.

QUALITY—Because they are steel throughout except pole, reach and doubletrees. Steel, assembled with rivets driven hot. A big turntable surface, a trussed pole that won't warp, sag or break; strap-end singletrees, patented wheels with rim oiling device that keeps the tires tight, steel bolster standards and a dozen other real features.

IMPROVED CONSTRUCTION—Because by building the springs into the gear, in combination with our equalizing device, the bed is no higher than on a gear without springs, steel bolster standards have holes for bolting direct into bed stringers; tying everything solidly together. By means of the equalizer, the springs act at all times—empty load—half load—full load, its always the same EASY RIDING and LIGHT RUNNING.

PRICE—Because the gear sells for about the same as any good wagon gear of the same capacity of the old (wooden) rigid bolster type. When you consider that bolster springs—a make-shift proposition at best—add $15.00 to $20.00 to the cost of the old style outfit, you can see where you save money.

BUT REMEMBER—Place your order early, if your dealer does not carry it, he can get it, but it will be at least two weeks after he places the order before we can make shipment—don't blame him, or us, if you wait till the last minute before looking into this wagon. Write TODAY for the booklet.

Hamilton Orchard Heater

The Only Orchard Heater with Fire Control

Mr. A. Gregory, manager of the Mutual Orange Distributors of Redlands, is equipping 150 acres of his orange groves with the

King of All Orchard Heaters

having purchased 8000 Hamilton Reservoirs, six gallon size, with a storage capacity of 48,000 gallons with one filling.

In considering orchard heaters Mr. Gregory purchased this one for the following reasons:

First—On account of its large storage reservoir, therefore large heat capacity.

Second—Its absolute control, burning oil only as weather conditions require.

Third—Because of this fire control a greater volume of heat in cold, early morning hours, can be obtained.

Fourth—Large volume of heat instantly obtained to meet any emergency.

Last—Construction; cover sliding on can not blow off; no seams to leak; won't tip and spill oil.

Frost season is near; get your order in early and have protection; requires 4 weeks to deliver goods. Send for our Red Book.

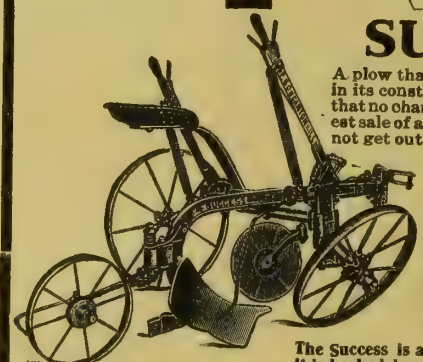
P & O



SUCCESS PLOWS

A plow that has been on the market for years without a change in its construction; a plow that was so well built at the start that no changes have been necessary; a plow that has the largest sale of any riding plow made; a plow that is so simple it cannot get out of order, so strong that it lasts a lifetime—

Such Is The Success.

It has the strongest and simplest frame ever put on a riding plow; the best hitch, the best landing device, the best rolling cutter, and bottoms ever made. It has but two levers, but they give the same wide range of adjustments as plows with three or four levers The **Success** is heavier; it has more material, but fewer parts, and therefore less complicated, than others. That is why it is simple, strong and durable. That is why we call it the **Success.**

The Success is a medium-priced plow that will work anywhere, and it is backed by an unqualified guarantee. Why buy a high priced plow when you can accomplish the same results with the Success, a medium-priced plow?

When so ordered, we furnish Alfalfa Shares, which are broader than the ordinary shares.

Insist on getting **P. & O.** Canton Plows, Harrows, Planters, Cultivators, Potato Diggers, Stalk Cutters, etc., from your dealer.

Vol. XXXVII. No. 18. LOS ANGELES: THURSDAY, NOVEMBER 2, 1911 One Dollar the Year

Importance of Irrigation Districts to California

An Address by J. L. Craig at the Annual Convention of the State Realty Federation at San Francisco

I carefully weigh my words, when I assert that the irrigation of the arid and semi-arid lands of the state is the most important subject now commanding public attention, relating to the development of the state's resources and the increase of its wealth. Consider momentarily the magnitude of the proposition.

The state of California embraces 101,350,400 acres. Of this area, not exceeding 35,000,000 acres is arable, of which 6,125,000 acres is now under cultivation. Of this cultivated acreage, approximately 5,065,000 acres is not irrigated, and 1,060,000 acres is under irrigation.

What of the products of these non-irrigated and irrigated lands? As nearly as can be determined from the statistics at hand the 5,065,000 acres non-irrigated lands produced in 1910 land products having a value of $140,047,000, an average of $27.60 per acre; while the value of the products of the irrigated lands was $163,521,000; an average of $154.50 per acre.

Had the people of the state, particularly its bankers and capitalists, also the state itself, through its legislators and executive officials, given during the past twenty years the attention to the promotion of the building of irrigation works, which the importance of the subject demands, an area at least equivalent to the entire 6,125,000 acres cultivated in 1910 would have been irrigated, with the result that the value of the farm products for that year, instead of totaling $303,568,000, would have exceeded $900,000,000. Can you estimate the effect of this 200 per cent increase in the value of the land products upon the expansion of the state's manufacturing, mercantile, transportation, commercial and financial interests? Do I exaggerate, when I state, that the irrigation of the arid and semi-arid lands of the state is the most important subject now presented for public consideration?

Returning to the 35,000,000 acres arable lands embraced in the state, of which about 6,000,000 acres are now cultivated, it is estimated, that not exceeding 15,000,000 acres can be irrigated, and such maximum area only when the surplus winter waters are carefully impounded for use during the irrigation season and the water is economically distributed, as to quantity, on the lands. The problem which confronts the people of the state is the construction of storage reservoirs, dams and irrigation systems, which will furnish and place water on the 15,000,000 acres of land.

Are there any favorable conditions affecting the propositions? I mention:

First—Economy of construction, owing to the adaptability of the sections supplying the water, to the construction of dams, reservoirs, main canals and laterals. The average cost of these works, owing to the topography of the country, is, in Colorado, Idaho, Wyoming, New Mexico and other states and territories, $35 to $40 per acre of lands irrigated; while in California the expense is from $15 to $25 per acre.

Second—Great fertility of the irrigable lands. No great body of such lands approaches in fertility the 11,000,000 acres located in the great Central Valley of California. The resultant exceeding productiveness of the lands enables the landowner to readily pay the yearly charges accompanying the distribution of water on his land.

Third—And most important, the best statute extant providing for the construction of irrigation systems. I refer to the "Bridgeford Act," which was enacted in 1897 and which replaced the "Wright Act," under which public irrigation systems had been constructed during the preceding decade.

Briefly, the "Bridgeford Act," authorizes the landowners of a section, the boundaries of which are determined by these owners, to organize such section into an irrigation district. The qualified voters of the district then elect a board of directors and, also, an assessor, tax collector and treasurer. The board of directors administers the affairs of the district in accordance with the provisions of the statute. The tax collector and treasurer are under bonds for the faithful discharge of the duties of their respective offices. When the organization of the district is completed, an engineer is employed to survey, plan, lay out and estimate the cost of the irrigation system.

All irrigation districts organized after May 10th, 1911, are placed under the jurisdiction of a commission, composed of the attorney general, the state engineer and the superintendent of banks. This commission passes upon the feasibility of the irrigation districts' systems and determines the amount of bonds to be issued by each district. These bonds are to be registered with the state controller.

The board of directors, upon receipt of the commission's report, calls an election, at which the question of the issue of an amount of bonds sufficient to meet the expenses of constructing the irrigation system is submitted to the voters of the district. If a majority of the votes cast are affirmative, the bonds are issued. The bonds are serial, maturing in twenty to thirty years and bear 5 per cent interest. They are a first lien on all the lands in the district. The board of directors has power to levy taxes to meet the interest on the bonds and administrative expenses of the district. In the event of non-payment, the property against which the tax stands is sold, as is the case when county and city taxes are not paid.

The irrigation district organization has the following advantages:

First—It is a system of local self-government. Therefore, the business of the district is wisely and economically administered.

Second—The expense to the landowner per acre for the water used is much less than when distributed by private corporations. The charge to the district irrigationist averages from $2 to $3 per acre annually; while the corporation irrigationist usually pays yearly from $4 to $7 per acre.

Third—When all bonds issued for the construction of the works are paid, as must be the case by the expiration of thirty years, the district, i.e., the landowners, own the irrigation system free of incumbrance.

Yet, notwithstanding the great advantages provided by the "Bridgeford Act" for the construction of irrigation systems, it must be regretfully acknowledged, that but five irrigation districts, organized prior to July 1st, 1911, embracing less than 430,000 acres (the systems of two of these districts containing about 140,000 acres being yet uncompleted), exist in the state. This, outside of the very recent organization of two additional districts, is the net result of the operation of the "Bridgeford Act" covering a period of nearly fifteen years—an average of 30,000 acres brought under irrigation per year. At this rate, 500 years will be required to place water on the 15,000,000 acres irrigable lands within the state.

The question naturally arises—Why this unsatisfactory condition? Why this slow, snail-like progress? Before answering, it may be stated in a preliminary way, that it is evident that the construction of irrigation district systems depends upon the receipt of proceeds from the sale of the district's bonds and that if the bonds are not sold, the work of constructing the irrigation systems cannot proceed. As a matter of fact, irrigation district bonds have during the past fifteen years, only been marketed with great difficulty in comparatively small volume, at low prices, considering the high quality of the securities.

The principal reasons for the situation just described are these: Prejudice against irrigation district bonds arising from the failure of several districts organized twenty or more years ago under the "Wright Act;" the organization in the Rocky Mountain states during the past five years of illy-advised and over-capitalized private irrigation corporations, which have defaulted the interest on their bonds; the opposition of the bank officials and the bond dealers of the state to irrigation district bonds, and the indifference, one might say apparent animosity, of some of the administrative officials of the state to these securities.

It is of no avail to say that what occurred twenty to twenty-five years ago should not now militate against the bonds; that the failure of private irrigation companies in other states should not affect securities issued by a municipality of this state; that bankers and bond men should rise above a desire to hold the market for the bonds of corporations in which they have a financial interest and that public officials should be so impervious to the sometimes almost intangible influence of a desire to stand well for political reasons with the "money power," that only consideration for a rapid and unparalleled development of the agricultural resources of the state should determine their action in reference to the securities of irrigation districts. But unfortunately, it is a condition and not theories of why the situation should be different than it is, that confronts us.

Can the situation be improved? I reply, there are two lines on which practical results can be produced.

First—Show your banker and capitalist friend that no better securities than irrigation district bonds are issued in the state, and as proof, call his attention to the fact that no existing district is in default in the interest on its bonds, and that fully $1,000,000 of the bonds of the Modesto, Turlock and Alta districts, issued in 1902, are held by merchants, bankers, farmers and other business men of these districts; also, point out to the banker and the capitalist the necessity of establishing a market for the bonds, in order that irrigation district systems may be constructed, to the end that the development of the agricultural resources of the state may add tremendously to its business activity and wealth.

Second—Use your influence to induce certain of the state officials to execute the provisions of the statute known as the "Irrigation District Bond Act," approved by the Governor March 10, 1911. This act was intended by the members of the legislature, speaking for the people of the state, to broaden and increase the market for irrigation district bonds. To accomplish these results, the bill provides:

First—That the bonds shall be legal investments for all trust funds, and for the funds of all insurance companies, banks, banking institutions and trust companies and for the state school funds, and

Second—That the bonds may be used or deposited by banks, with the state treasurer and county and city treasurers as security for public moneys.

(Continued on Page 421.)

Citrus Trees Exclusively

We have to offer for planting season of 1912 an excellent stock of strictly first-class Citrus trees in all varieties.

REMEMBER, MR. PLANTER, we have had twenty-one years of experience in the successful propagating of Citrus trees, and while our prices might be a little higher than our competitors, we absolutely guarantee our trees true to name. We are in the business to stay; hence, can back up what we say.

THINK WHAT THIS MEANS TO YOU. The average nursery is in business today and out tomorrow, so you have no recourse should anything go wrong. In addition to guaranteeing our trees true to name, we select our buds only from best individual fruiting trees, which would eliminate the possibility of having non-fruiting trees, or poor bearers in your grove. We follow the same plan of bud selection as the government experimental work.

Our trees are all budded from 3 to 7 inches above the surface of the ground, which will eliminate any possibility of planting the bud union below the surface of the ground. This particular point should receive due consideration.

Our booklet, entitled "Citrus Fruits," mailed to any address on receipt of 25 cents; credit given for this amount on first order.

Write us today for prices and information. All correspondence most cheerfully answered.

San Dimas Citrus Nurseries

SAN DIMAS, CAL.

Citrus Trees

First quality trees will be scarce in 1912

The man who plants an orange or lemon grove is planting for a lifetime. Poor trees cannot be considered at any price if he wants good results. A few cents per tree saved at time of purchase often costs dollars per tree in after years.

Why not buy the best? The quality is there and remains long after the price is forgotten. We offer a limited quantity of strictly first-class, healthy trees, one year old buds, for 1912:

6500 Eureka Lemons
2000 Villa Franca Lemons
9000 Washington Navels
750 Valencias
500 Marsh Seedles Grape Fruit

Budded on sour stock roots, grown in loose soil, clean, vigorous trees, guaranteed true to name. These trees have been carefully grown, are straight, and extra care was taken in selecting buds from the best fruiting trees, the parent stock which is of proven prolific habit—thus insuring good bearing trees.

Longer life through seed and bud selection. The above cut shows what these trees were at the time of budding, October, 1910, measuring four to five feet high. The trees now show for themselves. A large portion of them measure from five-eighths of an inch to three-quarters of an inch and have been pronounced by experts to be the finest bunch of one year trees they have ever seen.

We invite inspection and comparison, and solicit correspondence. We will sell these trees at current prices. We will refund traveling expenses to any out of town purchasers. Twenty years experience in expert citrus horticultural work.

Dewey-Greenleaf Citrus Nursery

Telephone Chas. Dewey, residence phone "Sunset 113 R." | Twenty-sixth and Mountain Ave., Upland, San Bernardino County, Cal.

N. B.—These trees will pass inspection—no scrubbing.

Citrus and Tropical Fruits

COST OF AVAILABLE NITROGEN.

E. B. Voorhees shows in a bulletin of the New Jersey Experiment Stations that 40 per cent of the total amount annually expended for fertilizers in that state is paid for nitrogen, and this is probably typical for all regions where fertilizers are generally used. Moreover, nitrogen is the only one of the three essential elements of plant food likely to suffer any considerable loss in use, not more than 70 per cent of the nitrogen applied in the best forms being recovered in crops. There are no such losses of phosphoric acid and potash.

"From the standpoint of crop it is evident that the utilization of nitrogen is a much more important matter than the use of phosphoric acid and potash, although the further fact that a pound of nitrogen, capable of being used in a commercial fertilizer, and without regard to form, costs from four to five times as much as a pound of 'available' phosphoric acid or of potash, is an additional argument in favor of greater care in its purchase and use.

"Nitrogen as nitrate is the only commercial form soluble in water, ready for immediate use by most plants. Nitrogen as ammonia is also a form soluble in water, but it is less available than the nitrate. A pound of nitrate and a pound of ammonia, being definite chemical compounds, are quite as good from one source as another.

"Organic forms of nitrogen have to decay first, changing to ammonia and then to nitrate, and are therefore less quickly available; besides, they vary in their rate of availability according to the source of supply and their physical character. Materials which are likely to decay quickly, as dried blood, dried meat, dried fish, and cottonseed meal, do show a high rate of availability, while forms like ground leather and ground peat show a very low rate of availability. A pound of organic nitrogen varies in availability, therefore, according to its source, whether derived from dried blood or peat or from intermediate products.

"Since nitrogenous materials are variable in their rate of availability—that is, the rate at which the nitrogen in them may be absorbed by the plant—the farmer desires to know the dependence that can be placed on the different materials He wants available nitrogen. Hence the chemical and physical characteristics of the various forms of nitrogen have been made the subject of very considerable study and investigation, in order that at least approximate values in respect to availability may be attached to each form. Sufficient work has been done thus far to establish a pretty safe relationship between the nitrate, ammonia and organic nitrogen, in the form of dried blood."

The results of comparative experiments by the New Jersey Station show "that the recovery for nitrogen as nitrate was 62.09 parts per hundred; for the nitrogen as ammonia, 43.26 parts per hundred; and for organic (dried blood) nitrogen, 40 parts per hundred."

"With the returns from nitrate, the highest recovery regarded as 100, the relative availability of the nitrogen as ammonia would be 69.7, and of nitrogen as dried blood 64.4.

These figures possess a very great practical significance, as they have a direct bearing upon the economical purchase and use of the nitrogen contained in the fertilizers now offered upon the market.

"Commercial conditions fix the price of the various nitrogenous materials, and the cost to the farmer of any one form is not measured by the usefulness to him, but by the cost in the market. That is, there is no strict relationship between commercial and agricultural values.

"It happens that at the present time a pound of nitrogen in the form of nitrate or of ammonia costs the farmer less than a pound of organic nitrogen; that is, the nitrogen possessing the highest rate of availability as nitrate is less expensive to him than dried blood nitrogen, or even that derived from low grade nitrogenous materials, which do not possess any definite rate and which must, on the average, show a much lower rate of availability than dried blood, because the mixtures contain nitrogen derived from many sources, not uniform in their content of nitrogen or in their physical character or constitution.

"The experiment station has since its establishment consistently urged the farmers, in their purchase of fertilizers. to be guided not only by the quantities of the constituents present in the mixtures offered, but also by the kind that is used in them, pointing out the importance of selecting brands which contain high percentages of available plant food, more especially of nitrogen, because of its relatively greater importance or its higher cost."

The station does not discourage, but strongly encourages, the use of waste products containing nitrogen, but it insists that—

"The cost to the farmer of a pound of nitrogen in these materials, of a value lower and more variable than the nitrate and ammonia, should be lower rather than higher than for nitrate or ammonia.

"It is not economy to save refuse nitrogenous materials if the cost of the nitrogen to the farmer is greater and his returns less than may be obtained by the use of nitrogen from materials of known value. Farmers have been and are now spending thousands of dollars for nitrogen for which they do not receive a proportionate return.

"To the farmer it is purely a business proposition. He buys nitrogen in order that he may get a return in crop. If in one case 100 pounds of nitrogen contributes 60 pounds to the crops upon which it is applied and another 100 pounds contributes but 40 pounds to the crops, the purchaser should not pay the same for the second as for the first, for if he did so he would pay 50 per cent more per pound for his 'available' nitrogen. That is, if the cost of the first hundred pounds were $15, the second hundred should cost but $10 when the basis of value is the amount available in each."

I know of no more encouraging fact than the unquestionable ability of man to elevate his life by a conscious endeavor. It is something to be able to paint a particular picture or to carve a statue, and so make a few objects beautiful; but it is far more glorious to carve and paint the very atmosphere and medium through which we look, which morally we can do.—Thoreau.

THE CONTROL OF CITRUS PESTS IN ARIZONA.

By A. W. Morrill, Entomologist.

While the control of citrus pests, except as applying to the citrus thrips, grasshoppers and a few minor pests, is not a subject of immediate importance in Arizona, a brief outline of the methods employed in Florida and California should be of general interest. It should also provide no little encouragement to citrus growers, especially those who are now getting their first experience in this line, for it should emphasize the fact that Arizona's present advantages in not having serious pests to require a perpetual tax on citrus growers more than offsets the troubles which have to be contended with in comparatively new citrus growing regions.

Methods of control of citrus pests may be included under the divisions of spraying, fumigating and the use of natural enemies. Other methods are sometimes of importance in special cases, but in general they should be considered only as adjuncts to the divisions mentioned. In the application of the various remedies, best results are secured when the insects to be treated are thoroughly understood. In spite of the many years during which most of the important pests have been under investigation from time to time, new discoveries are continually being made by investigators, and the remedies in each case are becoming better adapted and better understood.

Spraying is the oldest general remedy for citrus pests. In the case of most citrus insects it is a much less satisfactory process of control than fumigation. It usually requires three or four applications of spray to accomplish as much as would one fumigation, and the economy in the long run favors the latter process. In Southern California a distillate oil spray was used extensively a few years ago, particularly against the black and red scales, but much injury to trees resulted, and today comparatively little spraying is done in citrus groves in this section of the state. In the central part of the state spraying is coming into use in Tulare County in the control of the citrus thrips. A mixture composed of a tobacco extract combined with a weak distillate oil emulsion is used, several applications during the season being required.

In Florida spraying has been used to a considerable extent against citrus insects. In the case of scale insects, parasites or contagious diseases of the insect can usually be relied upon to reduce the damage to a point which makes spraying unprofitable. Sporadic outbreaks occur, however, which result in severe losses unless spraying or some other direct remedy is resorted to.

Fumigation for citrus pests was first practiced about twenty-five years ago. Today this remedy costs the citrus growers of California an amount estimated at more than a million dollars per year. During the year ending October 1, 1906, in a single county, Los Angeles, according to the official report of the County Commissioner of Horticulture, about $300,000 was expended in fumigating.

In Florida fumigation is now coming into general use, and doubtless will be extensively used in the future. The Florida method, first used in the fall of 1907 in connection with the white fly investigations of the United States Department of Agriculture, has so simplified the process that uniformity of results can be attained without previous experience. This method consists of a fumigating tent marked with graduated stripes for use in connection with a form of dosage table adaptable for use against any insect. With this as a basis, it is a simple matter for an experimenter to determine the dosage requirement for any particular pest, although previously it was impracticable to give any specific recommendations as to dosage. This Florida process is now coming into general use in California, and, according to the report of the Entomologist of the United States Department of Agriculture for 1909, it will eventually result in an annual saving of from 30 to 50 per cent of the former cost of fumigation.

The so called natural enemies of citrus insect pests include fungus parasites, predacious insects and parasitic insects. The fungus parasites are partially effective in Florida and other Gulf Coast citrus growing regions, but experimental work has so far failed to show the practicability of increasing the efficacy of these fungi by artificial means.

Of the predacious insects, several imported species of ladybugs are notably successful in California in checking citrus pests, and their value is inestimable. Control by means of true parasites has not met with complete success so far in any instance, but important work in introducing parasites of several scale insect pests is now in progress under the supervision of the state insectary at Sacramento.—In Circular No. 5 of Arizona Entomologist.

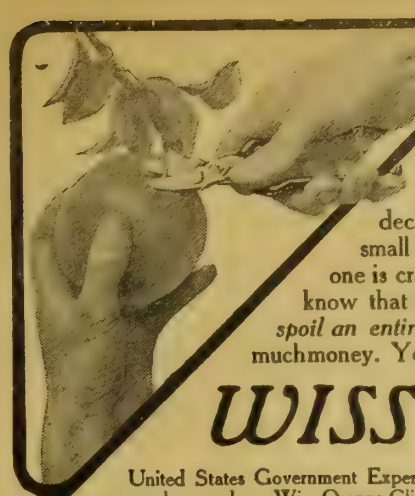
OUR UNDERGROUND WATERS.

Water is found in some amount in all formations below the earth's surface, from the loosest and most porous sands and gravels to the hardest slate and granite. The amount varies from the merest trace chemically combined in the molecules of the rocks to immense reservoirs which supply wells flowing hundreds of thousands of gallons a day. Some waters are so pure that a refined chemical analysis shows only minute traces of organic and mineral matter; others are so heavily charged with minerals or other impurities as to be unsuitable for use.

The slope of the surface at any point is one factor determining the amount of water absorbed by the ground. The direction and amount of slope also determine the form of the water table—that is, of the upper limit of saturation. Except where the surface is flat the water table is generally not parallel with the surface; it is almost invariably farthest from the surface on the summits of hills and mountains and nearest to it in valleys and along the coast, reaching the surface in swamps and along rivers, lakes, and beaches. The surface of the water table is always in motion, its higher portions flowing toward the lowest outlets along rivers or the sea. This direction of flow explains why fresh water is usually found when a well is dug in a sandy beach.—From Water-Supply Paper 223, United States Geological Survey.

Pleasure is the happiness of the animal nature; joy, of the social nature; blessedness, of the spiritual nature. Pleasure we share with the animals; joy, with one another; blessedness, with God.—Dr. Lyman Abbott.

The heroes are not all six feet tal,,
Large souls may dwell in bodies small.
The heart that will melt with sympathy
For the poor and weak, whoe'er it be
Is a thing of beauty, whether it shine
In a man of forty or a man of nine.



Stop *Bruising* Fruit and *Losing* Money.

Every time your clippers pierce an orange's skin you open the way to decay. Usually the cut is too small to *notice*—and the bruised one is crated with the good. *You* know that *one decaying orange may spoil an entire crate*—you lose just that much money. You *won't* bruise fruit if you use

WISS ORANGE CLIPPERS

United States Government Experts and leading citrus growers everywhere endorse Wiss Orange Clippers because they *know by experience* Wiss Clippers *last longest, do best work* and *save money* by *minimizing* the liability of bruising the fruit.

The blades are specially curved and ground—the points and outer edges are smoothened and rounded to avoid bruising. Handles are shaped to prevent tiring of the hand. Wiss Orange Clippers will give years of service — and are unrestrictedly guaranteed to give satisfaction. *For sale by all dealers.*

Wiss Solid Steel *Pruning Shears* will snip a broom handle and cut the most delicate tendrils. All parts are interchangeable and any broken parts can be readily replaced. 9-inch size, $2.25.

THE CANNING BUSINESS.

In 1817 William Underwood arrived in New Orleans from London, where he had learned the trade of preserving and pickling. The climate of the South not being to his liking, he walked from New Orleans to Boston, and there he and Charles Mitchell began the preserving of pickles, sauces, jams and fruits. They used glass jars, but these were both expensive and fragile, so tin cans were substituted by Thomas Kensett in 1825. This appears to have been the initial stage in this country of the business which has grown so great. Various improvements have been made from time to time in the methods of manufacture, but the principle of Appert has not been changed.

Tomatoes, called "love apples" by Appert in his work on canning, were first packed for commercial purposes by Harrison W. Crosby in 1847, at Jamestown, N. Y.

ears can be fed into the machine. The corn then goes through the silking machines, where a considerable part of the silk not removed in husking is separated.

From the silker it passes to the steam cooker, where the syrup is added, and the mixture undergoes a cooking process. The cooker then takes the cans from a chute and automatically fills them with corn, the machine being so regulated that the same amount of corn goes into each can. The cans are then wiped, and the caps put in place and passed on to the power capper. This power capper, which is a machine having six or twelve capping irons, solders the caps on the six or twelve cans as quickly as a man could cap one by the old hand process. But even this satisfactory method of automatic capping and soldering is now being displaced by the operation of a machine that caps the cans effectually and hermetically

A San Joaquin County Orchard.

Owing to many adverse conditions the business was of comparatively small importance until about 1850. During the next few years the development was rapid and the variety of goods packed increased, and included fruits, vegetables, oysters, fish and meats. Maryland soon became the chief center of the industry, but Maine, New York and New Jersey were also prominent. California and the states of the Middle West show a large growth in recent years, and the industry is fast expanding to all parts of the country.

The principles first employed in canning processes have continued to the present time; it is in the invention and use of labor saving devices that great advancement has been made. As an instance, at first corn was cut from the cob by hand and placed in the can together with a small quantity of syrup or water, to which sugar and salt had been added. The tops were then soldered on by hand, with the use of a tinner's copper, and the cans placed in the cooking kettle, where they were left in boiling water for from thirty to sixty minutes. A small hole was then made by pricking the can and the heated air and vapor allowed to escape, after which the can was again sealed and returned to the kettle of boiling water, where it was necessary to keep it for several hours.

Canning by Machinery.

This method of operation is now entirely obsolete. The continuous cutters of the present time are run by power and cut the corn from a continuous stream of cobs as fast as the

without solder, simply by twisting or turning together the edges of the tin so tightly as to exclude air. This applies to cans for all kinds of sealing.

Each cap has a small hole or vent in the center, left to permit the escape of steam during the capping process. This hole is then closed with a drop of solder and the can inspected for leaks. They are then passed on to the steam process kettle, where they are heated to a degree and for a length of time sufficient to insure the destruction of all living germs. The degree of heat and the length of time necessary to accomplish this varies according to the kind of goods in process.

Application of Heat.

Green corn requires the highest degree of heat for its preservation and strawberries about the lowest, the amount of acid present having much to do with this difference.

In the early days of the canning industry this processing was done in pans set on brick arches; these in time gave way to the steam boiler or open retorts. But the boiling point was the greatest heat to be obtained by such methods, and some kinds of canned goods required a higher temperature to insure their preservation. This led to the closed steam retorts of the present time, in which any desired temperature can be obtained. By the use of the closed retort corn is now subjected to a temperature of approximately 250 degrees Fahrenheit, and requires only about an hour for processing where it required from five to six hours by the old method.

Early canning was done in pack-

ages of glass or pottery, but because of its greater cost and the increased care necessary for their use in packing process and their impracticability for transportation on account of their weight and liability to breakage, the extraordinary growth of the canning industry is due in no small degree to the invention of tin cans.

New York leads in canning corn, apples and pears. New York and California between them do about 90 per cent of the fruit drying. Maryland, in addition to oyster canning, does a great deal of canning of tomatoes, peaches, peas, lima beans, corn, pineapples and pears. Most meats are canned in the cities where the great slaughter houses are located, and the fish in the seacoast towns and cities.

The canning of lobsters and mackerel was begun at Eastport, Me., in 1843. Salmon canneries were started on the Columbia River in 1866, and at Kiawak, old Sitka and Cook Inlet, Alaska, in 1878 and 1882. The labor there is chiefly performed by Chinese. Next to this business on the Pacific slope, the most important is the sardine canning, in Maine. Sardine is a name generally applied to small fishes. The best known are the young of the pilchard (France) and of the sea herring of the Maine coast. They are first fried in oil and then canned in oil.—New York Times.

A TOAD'S BUSY EVENING.

It is well worth your while some evening in summer to watch a toad going about his business. Let me describe his methods to you. Watch in the evenings, when he comes out from the cool place in the soil where he has spent the day, and see what he does.

First he will look around and see what the weather is going to be like, and, if it suits him, he will start off on his rounds. He is regular in his habits. You know there is a peculiar dignity about a toad that always reminds you of an alderman. You never see a toad smile. The lower the intellect of a creature the less it laughs. The toad then marches off to the nearest place of refreshment, a post, a bush or a stump, or something of that kind, to which he knows insects resort, and then you see him place himself in that sort of attitude we used to assume when boys and girls: "Shut your eyes and open your mouth, and see what God will send you." Presently an ant walks up the post, there is a quick motion and that ant has gone to join the great majority. Another one passes up, there is another quick movement, and that insect has gone also. You might look for a long time and you would not see how it is done. A toad's tongue is highly specialized, differing from any other animal's the tongue is hung in front and wags backward.

And so the toad goes round his night's work from one place of refreshment to another until, as daylight comes, like a city representative again, he goes home full, but it is full of insects which would have done an enormous amount of mischief. Therefore, he has spent his night usefully.

His good work goes on day after day, and yet we despise him. If a man see him, he kicks him out of the way. Another man says, "Do not touch him, he gives you warts." He will not give you warts; he needs all his warts in his own business. This sort of remark and others are said about the inoffensive toad, simply because he is not beautiful. If we were judged by our beauty, how would we come out? Even the most insignificant forms of life have their part to play in nature, all of them assist in carrying out that most important of nature's laws, the maintenance of the balance between all forms of life; and where we interfere we invariably do it to our own injury.—American Cultivator.

APPLE SHOW IN WINDOWS.

The second annual apple window display held in Walla Walla, Wash., will be given under the auspices of the Commercial Club during the week of October 30-November 5. This is a novel plan of getting interest in the apple industry, and at the same time advertising the country as an apple district.

Three prizes, of $25, $15 and $10 are offered to the merchants of the city for the best decorated windows during the week, apples to make up at least half the material used in the decoration. Allowance is made for the shape and size of the windows, so that the smaller stores have an equal chance with the larger ones. The windows are marked on points, as follows: Attractiveness, 40; originality, 20; most advantageous use of apples, 10; inexpensiveness of display, 10; arrangements of signs, show cards, etc., 10. The judges will be men brought in from outside cities.—Harold Ellis.

IMPORTANCE OF IRRIGATION DISTRICTS.

(Continued from Page 417.)

The superintendent of banks holds that savings banks, the greatest probable purchasers of the bonds, cannot buy them. He is nullifying a perfectly plain provision of the statute.

The governor, controller and state treasurer determine the bonds which shall be accepted by the state treasurer as security for state money. An application for a deposit of state money on Turlock Irrigation District bonds (securities upon which the interest has been promptly paid for nearly ten years) was made by a San Francisco bank nearly sixty days ago. The application has not yet been granted. Write the superintendent of banks, asking him why he will not permit savings banks to purchase irrigation district bonds. Write the governor, the controller and the state treasurer, asking why Turlock Irrigation District bonds have not been accepted as security for a deposit of state money. Ask your local newspaper to publish the facts. Public officials cannot withstand public sentiment when it demands what is right, particularly when the action demanded of the official will exceedingly advantage a great public interest.

The problem at hand is the building as rapidly as possible of irrigation district systems, which will irrigate 15,000,000 acres of arid and semiarid lands. An average of 500,000 acres per year will accomplish the result in thirty years. This involves the marketing of $12,000,000 to $15,000,000 bonds per year—not a large amount when measured by the volume of money yearly seeking safe securities as an investment. A market must, as already stated, be developed for these irrigation district bonds before the work of constructing the systems can proceed.

The immediate and pressing need is the marketing of the bonds now in the irrigation districts' treasuries. It is necessary that these bonds be sold, in order to furnish money with which to complete the South San Joaquin and Oakdale irrigation systems and to extend the Turlock system. The banks of the state, possessing as they do over $100,000,000 assets, could readily purchase the $3,932,900 bonds—less than one-half per cent of the banks' resources—particularly since the absorption of the bonds will extend over a two-year construction period—an average of under $175,000 per month.

Concretely stated, what would be the result of the irrigation of the 15,000,000 acres? I answer, an increase in market value of, say, from $20 per acre, or $300,000,000, to at least $150 per acre, or $2,225,000,000—an increase from $300,000,000, the present yearly value of the land products of the state, to $1,500,000,000, and the addition of not less than 3,500,000 to the state's agricultural population, besides at least 1,500,000 added to the urban population through the increased business of cities and towns.

I have been in touch with the Modesto and Turlock Irrigation Districts since the water was placed upon the lands in 1902. During this ten year period I have noted an advance in the price of lands from an average of $10 per acre to more than $100; the yearly value of the land products increase from a scant $2,000,000 to over $8,000,000; a growth in population of the districts exceeding five fold, and that where only hamlets were, thriving cities stand, I have seen and I know.

These statements are given you with the hope that the welfare of the present land owner and future colonists shall be carefully guarded. The state of California, through its various promotion bodies, spends hundreds of thousands of dollars annually to induce homeseekers to locate within its borders.

Small Fruits and Vegetables

THIS MONTH.

Strawberry plants may be set this month, though the greater number will be planted through next month or possibly January. Other small fruits should have the dead canes pruned out and in the latter part of the month replanting may begin. All the hardier plants, such as celery, cauliflower, cabbage, parsnips, salsify, beets, radishes, rhubarb plants and peas, may be planted. Heavy manuring of the garden will put it in good condition for early planting of next month and January. For the early planting most thoroughly rotted manure should be used. For the later spring planting strawy manure may be plowed under and will put the ground in excellent shape.

Rubbish should be raked up and burned, or if preferred for composting old vines, should be thrown into the heap and kept thoroughly wet. It is wise, however, to use these vines on orchard or other fruits, as sometimes fungus troubles are carried to the next crop because of such use of last year's vines.

SEEDS FROM FOREIGN LANDS.

A high record importation of twenty million dollars' worth of flaxseed in the fiscal year 1911 is indicated by the records of the Bureau of Statistics, Department of Commerce and Labor, now completed for the ten months ending with April, 1911. During that period the imports of flaxseed or linseed, aggregated 8,250,000 bushels, compared with a little over 3,000,000 bushels last year and 53,000 bushels in the corresponding period of 1909. The growth in value is even greater, the ten months' figures of the current fiscal year being 16¾ million dollars, against five millions in 1910 and but $73,625 in 1909. The estimated importation of $20,000,000 worth of flaxseed in the fiscal year which ends with the present month exceeds by more than $10,000,000 the value imported in 1909, is nearly $18,000,000 above the record of 1901, and is by far larger than that of any other year. During the ten years 1901 to 1910, inclusive, a total of $13,000,000, or an average anunal importation of $1,300,000 is shown, as against $20,000,000 for the single year 1911 now drawing to a close.

Flaxseed furnishes the bulk of the $28,000,000 worth of seeds of various kinds imported during the year. The other leading classes include sugar beet, clover and castor beans. Of these, the imports of clover seed during the year will be about $3,000,000 dollars, and those of sugar beet and castor seed, each about $700,000. The remaining $3,750,000 worth of seeds imported includes grass, mustard, beet, cabbage, poppy and flower seeds, also a large number of seeds valued by reason of the volatile oils and perfumes contained, such as anise, caraway, coriander and fennel.

The price of imported flaxseed tends to increase from year to year. In 1897 the average price per bushel was $1.03; in 1901, $1.27; in 1903, $1.50; in 1909, $1.40; in 1910, $1.70; and in 1911, $2.04, for the high record importation of 8,125,000 bushels in the ten months ending with April.

Argentina is the chief source of the flaxseed imported into the United States, about 60 per cent of the imports during 1910 having been from that country, compared with about 25 per cent from Canada and about 4 per cent each from the British East Indies and Belgium. Nearly all the sugar beet seed imported is from Germany, while clover seed is imported chiefly from Germany, Canada and France.

The very large increase in importations of flaxseed during 1911 is due to the partial failure of the crop last year. The flaxseed crop of the United States is according to figures of the Bureau of Statistics of the department of agriculture, chiefly produced in Minnesota and North and South Dakota. The crop in North Dakota last year was to a large extent a failure, reducing the domestic production by nearly one-half, and the amount available for market purposes, aside from seed, fully one-half, hence the large importations in the current year from foreign countries.

The shortage in the domestic crop of flaxseed and presumably in the production of linseed oil is reflected in the large imports of oil of that character during the current fiscal year. During the nine months ending with March, 1911, the imports for consumption of linseed oil aggregated 3,207,425 gallons, valued at $2,193,679 compared with 467,664 gallons, valued at $258,390 in the entire fiscal year 1909.

By all means keep in mind the garden, and have plenty of good fresh peas and beans, corn and tomatoes, radishes and lettuce, cabbage and parsnip, turnips and beets, cucumbers and carrots. We fail to realize too often what all these mean; not only a saving in store supplies but better health and less doctor's bills. Home is the better for these things and children are happy and contented among such surroundings, and make better citizens.

Chicken wire makes a good trellis for tomatoes. A single stake will do, or a barrel hoop supported about two feet from the ground by three stakes is good.

Prune out old canes of raspberries and blackberries, and burn them. Thin the hills to three or four shoots. Cultivate, and add some manure to the soil.

Radish and spinach seed may be united and sown together in rows one foot apart on rich, thoroughly prepared soil. Mix one-third radish to two-thirds spinach.

If any fruits or vegetables are marketed, see that they are put up in clean, neat and well-graded packages. They will sell quicker and at a better price.

It often pays to grade strawberries very carefully. A customer pleased and satisfied means a steady market for produce.

Remember that too much water is as bad as too litle, because it fills up the interstices and smothers the plants.

A plot of ground 40 by 60 feet will produce sufficient vegetables to supply a family of five or six.

The Ornamental Garden

THIS MONTH.

Plant poppies; plant all kinds of poppies, of course first and last all the native eschscholtzias. Plant Shirleys. This latter beautiful poppy may be planted any month in the year, but this is an especially opportune time. Plant stocks, cineraria, primulas. Of course nearly all bulbs which have not already been planted should be put into the ground at once. Some bulbs like the gladiolus may be held back for another month or two, but all the Dutch bulbs should be in the ground. Amaryllis belladonna which have been in the ground several years, should be taken up at once, the bulbs broken apart and replanted. Roses should be doing their prettiest this month and if properly pruned and encouraged with a little nitrate of soda will throw a wonderful bloom for the holiday season, assuming they are given fairly good weather conditions. This is also a good time to make cuttings of roses, though if the weather stays warm it may yet be a little early. Carnation cuttings may also be started this month. These start quicker and are more satisfactory under glass, but with care may be started in hotbed or even in the open ground. Sweet peas may be planted if proper varieties are selected. It is too late to plant winter bloomers, but the newer orchid varieties may be planted and will bloom in the spring and early summer.

Plant a new lawn around the back door; slick up the back yard and put it into condition so that you will be proud to have your neighbors come to the back door. Lawns do not start so quickly at this time of the year as in the spring, but the fall planted lawn has the advantage of getting a good start of the Bermuda, for Bermuda does little growing in the cooler season.

CARNATION CULTURE.

It is now time to figure on getting into the benches the plants intended for indoor culture all summer. The first consideration is the cleaning up of the houses and repairing any of the benches that need it, these preparations should be carried out in a thorough manner so that there is no rubbish left around to harbor thrips or red spider; it is a very difficult matter to fight these pests under the very best and cleanest conditions without having old rubbish and dirt to serve as nests for them. Our next item is the compost, the most important feature of all, they need a good live fresh soil that is capable of producing a steady plant growth but not so overcharged with manure as to cause a long-jointed soft growth. The quantity of manure to soil should be governed somewhat according to the texture of the manure, if it is very well rotted one part to four of soil is all right, but if the manure is inclined to be on the fresh and green side it should be used in proportion of one part of manure to five parts of soil.

We place a very thin layer of well-rotted manure at the bottom of the benches and fill it with soil to the depth of five inches after it has been firmed down. A sprinkling of fine bone is put in the surface of the soil and well mixed in. The soil is then evened up. We are then ready for the plants. If these have been grown on the bench, they should be thoroughly watered long enough before the time of planting to allow the water to drain through the soil, so that it will not be muddy for lifting, also, if the plants are in pots they should be watered and allowed to drain before planting. Ten inches apart each way is ample space to set the plants. Plant firmly, leaving a slight depression around each plant so that watering can be done at the plant only, without wetting the remainder of the soil.

After the planting is finished, syringe the plants two or three times a day during the hot weather and give all the ventilation possible. After a few days the weeds will commence to appear, these should be removed as soon as large enough to handle, not allowing them to remain long enough to weaken the carnation plants. A very important consideration with these indoor-grown plants during the very hot weather is that of watering at the roots. The plants need a thorough watering in at time of planting, after this water should be given only as the plants are in need of it and then thoroughly. Do not keep the soil in a saturated condition, which is a cause of soft, spindly plant growth. The work of pinching back the growths will have to be followed up closely to make the plants break evenly. Another matter is to look out for the aphis, spraying regularly twice a week to keep them in check.—Gardening.

LILIUM HARRISII.

The bulbs of Lilium Harrisii for early winter blooming will soon arrive and preparations should be made to handle them as soon as they are received. They should be potted as soon as they arrive and then placed in a cold frame. They can then be brought forward as they are wanted. The bulbs can be planted either in pots or boxes and later if it is desired set out in the benches to bloom. While it takes a little longer to plant them in pots they transplant much more successfully than when disturbed in moving from the boxes. Place the bulbs for the early flowering in a four-inch pot and dig out a frame, place the pots side by side in the frame and give them a good watering, then sprinkle on the top a thin layer of sand or ashes and cover with three or four inches of soil, place shutters on the frame to keep them dark and cool until the bulbs have made roots. They can then be brought into the houses during the fall and early winter as they are wanted.

PRUNING SHRUBS.

The spring blooming shrubs are now nearly all done and the safest rule for pruning is to cut back into shape after the flowers have passed, when the shrubs begin their growth for the next season's crop of flowers. All the small weak growths should be cut out and the plants trimmed into proper shape. Unless this is attended to shrubs rapidly become a tangle of weak growths, bearing but few flowers, and grow into ungainly specimens. Too often this important work is left until too late and the blooming growth for next season is cut off with the result that there are no flowers the succeeding year. Privet hedges should be constantly pruned into shape so as to have a nice appearance and they will stand any amount of cutting as they grow very rapidly. August is the best time to trim berberis and they will need no further cutting back for the balance of the year.

PAYS FOR ITSELF EVERY THIRTY DAYS

CUTS THE SOIL TWICE

Without a doubt Clark's Double Action "Cutaway" Harrow with Jointed Pole is a most wonderful farm tool. It cuts the soil twice, throwing it in opposite directions, filling in the hollows, thus leveling the land. All Single Action Harrows have to be Driven in Half Lap. It is drawn by two medium horses. It can be set to move the earth but little, or at so great an angle as to move the earth eight or nine inches. Runs true in line of draft. A customer wrote recently that his "Cutaway" pays for itself every thirty days in labor saved.

The Jointed Pole takes all weight off the horses' necks, and keeps their heels away from the disks.

We make a "Cutaway" for every crop. Every need is fully supplied by the different styles of genuine "Cutaway" Tools. If your dealer won't supply you, we will.

Write us. "Intensive Cultivation," our new booklet, is free. Send a postal to-day.

European Foul Brood

By J. D. Bixby, Covina, from Address Before Los Angeles County Beekeepers Association

The appearance of European or "Black" foul brood in the northwest portion of Los Angeles County has excited much interest, not unmixed with consternation, among the beekeepers of the county.

This specific form of bee disease is the most virulent known to apiarists. Its first recorded appearance in this country was in 1895, in Scoharie County, New York, whence it spread, in gradually widening circles, over a good portion of the state and into Massachusetts and Pennsylvania.

It is supposed to have been brought to New York in nuclei shipped from the South, or with queens from Ohio, or both, and was undoubtedly carried to Canada and various parts of this country in queen cages; not by the queens or their escort in themselves, but through the medium of the "candy" supplied for their food, this candy having been prepared with contaminated extracted honey.

Unquestionably it was brought to the Pacific Coast in this way, appearing first near Selma, Fresno County, two years ago, where large numbers of queens had been shipped from the East. From there it has spread rapidly through the San Joaquin Valley and across the Tehachapi into Los Angeles County.

Symptoms and Indications.

Three forms of larval bee disease are prevalent on this Coast: "pickled brood," which is usually the result of superannuated or defective queens; American foul brood, which is highly contagious but easily controlled by proper treatment, and European or black foul brood.

In pickled brood the larva becomes discolored and dies about the fifth or sixth day after hatching, few cells being sealed; turns tail outward in the cell and rapidly assumes a dark brown color; it has little odor and is not ropy; soon dries up and is removed by the bees. It is not contagious and is usually cured at once by supplanting the old queen with a young one, especially if of Italian stock.

In American foul brood, the larva seldom dies before sealing, in this respect being directly the opposite of black brood. Soon after being sealed the larva dies, becomes a brown, gluey, ropy mass, stringing out from one to two inches when tested, and of a horrible odor. The capping of the infected cells turns much darker, sinks down slightly, and occasionally has a a small hole in the center. A diseased comb can usually be detected at once by its dark color, and the foul smell observed the moment a hive is opened. It is exceedingly contagious, through honey, pollen, combs and hive.

Remedy.

The only method of cure is to shake the bees on to frames containing only starters of foundation, in a clean hive, caging the queen to prevent absconding. After three days, shake again on to healthy drawn combs or full sheets of foundation, giving, if possible, a frame of hatching brood from a strong colony; release the queen, and if honey is not coming in freely supply a comb of honey.

Great care should be taken to prevent robbing; all good honey should be extracted—cleaning the extractor thoroughly with hot water after the operation then boiling for an hour if it is ever to be placed where bees can reach it; the combs should be rendered at once into wax; the frames boiled in water, and the hive thoroughly disinfected by being scorched with fire inside. This can be done by sprinkling with gasoline, smothering the blaze by clapping the cover on when well scorched.

European foul brood varies more in its symptoms than either of the other varieties. Nine-tenths of the larvae die before sealed, usually about the fifth or sixth day after hatching. Those cells which are sealed will be very scattering, much sunken, and nearly always with a pin hole in the center. The larva usually curls back upward in the cell, head and tail down; a few may be found with the tail outward; a yellow or brown spot appears on the bowed-up back of the larva; under the glass it appears vein-like, doubtless corresponding to the circulatory system of the insect; in a few days it sinks down, becomes brownish in color and gradually dries down to a scale, being then removed by the bees. Often it sinks down to the bottom of the cell, discolors only slightly, and remains in that condition several days, looking very like a drop of tallow in the cell. The decayed larva is only slightly ropy, seldom stringing out over one-quarter of an inch; has very little odor, and this of a sour-sweet character something like fermenting green clover or fruit. Sometimes nearly all of a frame of young larvae 4 to 6 days old will be affected, being of a uniform light yellow or straw color, in contrast to the pearly white of the healthy larva. The only way to detect the presence of this disease out of the breeding season is by the thimble-like holes in the comb, extending to the mid-rib or septum, where the bees have gnawed around a cell to remove a larva not yet dried up.

The virulence of this disease can hardly be overestimated; in the little mountain valley of New York where it originated, were kept in the space of twelve miles, more than 3000 colonies of bees; four years after its appearance there remained but thirty colonies, eleven of these being Italians, all that were left of an apiary of 400 colonies. The inspector of Fresno County reports for 1910 over 30 per cent of the bees in his county diseased.

Black brood appears to be contagious not only in the ordinary modes but also through the nectar and pollen of the blossoms in the field, these being infected by working bees from diseased hives; no other theory can account for the almost simultaneous infection of hundreds of colonies in an apiary or a given bee range. It is quite possible, also, that the spores of the disease may be carried by the wind from apiary to apiary or from one range to another.

Treatment.

Fortunately, this form of disease is confined mainly to the dark-colored races of bees, the lighter Italians, our most valuable variety, being practically immune. Years of experiment have given us but this one effective remedy—Italian stock. Shaking, the McEvoy treatment, so effective with American foul brood, is useless, nine-tenths of the treated colonies being

Why not buy the best? 2 year old sweet stock all first class, clean, and well rooted. 25,000 one-year Sour Seed Bed Stock 8 in. and up.

T. J. LOCKE

Home Phone, Black 177

27 N. Stoneman Ave. ALHAMBRA, CAL

Orange trees for 3000 acres of land have been contracted for by planters near Lindsay, Tulare County.

re-infected at once, or at farthest, the next breeding season; a young black or hybrid queen will sometimes overcome a mild case of the disease, but only temporarily.

Re-queening with young Italian stock will save all colonies except those greatly reduced in numbers; these can have their queens killed and be united, to give a sufficient force to care for the young brood.

Now, mark: The essential point of this treatment is to have an interval of from ten to twenty days between the last old egg, and the first new one; this gives the bees a chance to remove the dead larvae and polish the cells for the reception of the new queen's eggs.

By this method all combs can be saved, and hives do not need to be disinfected. I would advise, however, that all combs very badly diseased and all black, imperfect ones, be melted into wax, as they retain the infection longer than comparatively new combs. In a few cases the disease may reappear, but usually only in a mild form, and a renewal of the queen generally effects a cure.

TUNGSTEN.

The mineral tungsten (the name meaning heavy stone) has been known for many years, but only comparatively recently has it become of economic importance. The most important use, according to Frank L. Hess, of the United States Geological Survey, and the one which makes tungsten mining on an extensive scale possible, is as an alloy for tool steel. Lathes using tools made from tungsten steel may be speeded up until the chips leaving the tool are so hot that they turn blue, an operation which would ruin the temper of high-carbon steel. It is stated that about five times as much can be done with lathes built for such speed and work as can be done by the same lathes with carbon-steel tools. From 16 to 20 per cent of tungsten is ordinarily used in lathe tools. The melting point of tungsten is exceedingly high—5,576 degrees F.

Tungsten also has an important use in making incandescent electric lamps, crucibles for electric furnaces, and various other articles.

A SUCCESSFUL IMPLEMENT HOUSE.

A few months ago the Cultivator gave information as to some of the successful business men of California, which we believed was received with interest by its readers. We take the liberty this week of referring to another of the most successful business men of the state. A look at his face, photograph of which appears below, will convince one that he has not long been in the business, but the success which his house has attained shows he is full of energy, hard work and capacity to select most competent helpers. The gentleman in question is Mr. Willard Arnott, head of the large jobbing house of Arnott & Co. He has been at the head of this concern for only five years, but the leaps and bounds with which the business has increased are proof of his ability. The company was established by his father, Mr. George Arnott, and Mr. Daniel B. Sumner in 1892. Within a few years Mr. Sumner died, and Mr. Arnott Junior was taken into the firm fresh from school. He took hold of the working end of the establishment and learned from bottom to top the details of the business. Upon the death of his father, five years ago, young Mr. Arnott took full charge of the business, which he has built up until today it is probably the largest of its kind in the Southwest, and is disposing every year of somewhere in excess of half a million dollars worth of general farm implements, automobiles, vehicles, engines, water lifting appliances, and practically everything in farm machinery. The concern now has thirty-five employes.

If it were asked what one factor has been greatest in the prosperity of this firm, we doubt not the answer would be, care in purchasing. Mr. Arnott has made one of his mottoes, "Arnott Quality Guaranteed," and to make that good he has exercised the greatest care in choosing his lines of goods and in insisting that everything should be of the highest quality. Once an article passes through the hands of the Arnott Co. it is known to be thoroughly reliable.

With all his capacity to handle an immense business goes a genial nature which makes Mr. Arnott a favorite with all with whom he comes in contact. We believe the firm will continue in its prosperous career and prove one of the greatest factors in the advancement of the Coast.

Willard Arnott.

TREES TRUE TO NAME

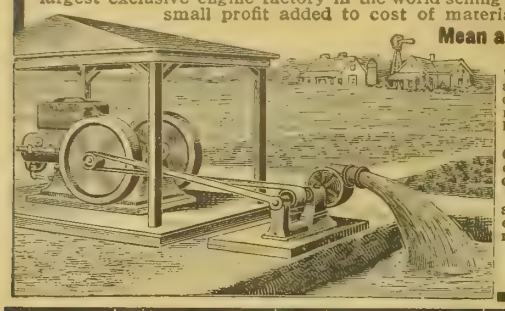
Pumping Engines and Centrifugal Pumps

MAKE the most economical and efficient pumping outfits on earth where large quantities of water are required. Galloway Pumping Engines are made in sizes to suit every purpose from 1½ h. p. to 15 h. p. They are built on honor, and so powerful, simple, economical and reliable that they are acknowledged everywhere as the most all-around satisfactory gas power possible to obtain. They are built in the largest exclusive engine factory in the world selling direct to the consumer with just one small profit added to cost of material and labor.



Mean a Saving to You of From 40 to 60%.

Galloway Centrifugal Pumps on account of the high efficiency obtained, their exceptionally simple design without valves or other complicated mechanism of any kind, are the ideal pumps for irrigation purposes or where large quantities of water are required.

A combination of Galloway Engine and Galloway Centrifugal Pump means ideal equipment at a great saving in price as compared with competitors prices.

Write us for full information. We have a special department for irrigation work with experts ready to work out your requirements.

MAKING THE MAP OF CALIFORNIA

Steady progress is being made in the construction of the great topographical map of California by the United States Geological Survey and the state. This huge map will be when completed a work of which both the federal government and California may well be proud. It will be made up of a large number of sheets of uniform size, each representing a rectangular area called a quadrangle. Already 170 quadrangles have been surveyed, most of them in great detail, and an atlas sheet for each has been engraved and printed by the survey. These quadrangles include areas ranging from the vast flat reaches of the Sacramento Valley to the glacier-laden peaks of the high Sierra.

Perhaps the most comprehensive and detailed topographic mapping in the world has been that of the broad Sacramento Valley, comprising an area of more than 3,000,000 acres. This has already been completely surveyed by the topographers of the United States Geological Survey in co-operation with the state of California, the survey and the state each paying half the cost. This mapping has been done on a scale of 2 inches to 1 mile with a 5-foot contour interval, each map showing an area of 7½ minutes square. The survey covers all land possible of irrigation between Red Bluff on the north and Suisun Bay and Stockton on the south.

Surveys of the same class are now being pushed southward under a similar co-operative agreement between the state and the Geological Survey. The present field season's plans include the mapping of the area near Stockton and farther south in the San Joaquin Valley. The maps will be on the same scale and contour interval as those of the Sacramento and the topographers expect to survey this season twelve 7½ minute quadrangles and later to continue the work down to the hill country south of Bakersfield. When this work is completed it will afford for the great twin valley empire of California an exact geographic basis for engineering development of any class, irrigation, drainage, road or bridge construction; in fact, any work requiring accurate determination of levels.

The possibilities lying in the reclamation of this extensive California valley are sufficiently stupendous to awaken the interest of the most ambitious engineer. The Sacramento river drains a vast mountain region and carries water sufficient to irrigate an estimated area of 12 or 13 million acres—not only all of its own immensely fertile valley but likewise the agriculturally almost inexhaustible lands of the San Joaquin Valley. The harnessing of Sacramento River is doubtless one of the great engineering problems of the country and millions of dollars have already been spent in largely futile attempts to control this rampant monster in time of flood, but there is no lack of engineers who believe the task a feasible one and point to the ample opportunities for storing in reservoirs in the mountains the enormous excess of water, most of which under present conditions not only flows uselessly to the sea but every few years carries destruction in its wake to the extent of millions of dollars.

This year's field work of the Geological Survey will include the completion of the survey of the nine following quadrangles in various parts of California, or so much of them as the funds available and the length of the field season will permit.

Bishop Quadrangle, latitude 37° to 37°30′, longitude 118° to 118°30′. This area lies largely within the Inyo National Forest, the valley portion being subject to development from irrigation.

Long Valley Quadrangle, latitude 37°30′ to 38°, longitude 118°30′ to 119°. This quadrangle also lies partly within the Inyo National Forest and contains the source of Owens river, which furnishes the water supply of Los Angeles, through the long aqueduct now being constructed.

Priest Valley Quadrangle, latitude 36° to 36°30′, longitude 120°30′ to 121°. This area is partly within the Monterey National Forest, adjoining the Coalinga oil fields. Within the last two or three years a railroad has been built into this region from the main coast line of the Southern Pacific.

Weaverville Quadrangle, latitude 40° 30′ to 41°. Longitude 122° 30′ to 123°. This area lies within the Trinity and Shasta national forests.

These four quadrangles are to be surveyed on the field scale of 1:96,000, about 1½ miles to the inch, with a contour interval of 100 feet.

Point Reyes and Petaluma Quadrangles, latitude 38° to 38°15′, longitude 122°30′ to 123°. These areas are adjacent to San Francisco Bay. They will be surveyed on the field scale of 1:48,000, 1½ inches to the mile, with a contour interval of 25 feet.

Borax Flat Quadrangle, latitude 35° to 36°, longitude 117° to 118°. This area lies on the desert of California and is particularly interesting from the fact that it supplies a large amount of the borax used in the United States. In the center of this quadrangle is the famous Randsburg mine. This area will be surveyed on the field scale of 1:192,000, about 3 miles to the inch, with 100-foot contour interval..

Big Bar Quadrangle, latitude 40°30′ to 41°, longitude 123° to 123°30′. This quadrangle adjoins the Weaverville area and is partly within the Trinity National Forest. It will be surveyed on the scale of 1:192,000, about 3 miles to 1 inch, with a contour interval of 200 feet.

In the Salinas Valley two 7½ minute quadrangles, on the scale of 1:31,680, 2 inches to 1 mile, with a 5-foot contour interval, are to be mapped. In the publication of most of the maps the scale will be reduced.

An index map of California, showing the quadrangles of which maps have been issued, can be obtained free of cost from the director of the Geological Survey, Washington, D. C. Most of the maps are sold at 5 cents each.

HOMESTEADER'S BURDEN LESSENED.

Settlers on national forests under the act of June 11, 1906, will no longer have to pay for a survey, as they have had to in the past on unsurveyed lands, when the claim goes to patent. This relieves many settlers under the act, commonly known as the forest homestead law, from a burdensome ex-

pense. Relief from this burden has been brought about by an agreement between the Secretary of the Interior and the Secretary of Agriculture, whereby surveys made by employes of the Forest Service will be under the supervision of the Surveyor General, so that they can be accepted by the General Land Office as final.

Hitherto it has been necessary to make two surveys. Under the terms of the forest homestead law, national forest land cannot be opened to settlement unless the Secretary of Agriculture has recommended to the Secretary of the interior that it be listed for settlement; and listing is not possible unless a survey has been made. The Secretary of Agriculture has no authority to list any land unless an examination has shown that the land is more suitable for agriculture than for forest purposes. So when land is applied for, employes of the Department of Agriculture are sent to ascertain its character, and at the same time make a survey of it by metes and bounds if a survey is necessary.

This survey, however, could not be accepted by the Land Department as a basis for patent, because only surveys under the supervision of the Surveyor General can, under the law, be accepted as a basis for passing title. In consequence, under the procedure provided for when patent is sought to unsurveyed lands, the settler on land within a national forest has had to pay for a second survey. This has been felt to be especially hard because it has subjected settlers on national forests to an expense which settlers on surveyed public lands do not have to bear. Since it merely duplicated the work of the first survey, there seemed no reason why this first survey might not answer both for listing the land and for patenting it.

The survey for listing, made by forest officers, has always been without expense to the prospective homesteader. Under the new arrangement the field expenses of the survey will continue to be paid by the Department of Agriculture, so that the applicant will merely be called on to meet the cost of checking up and platting the surveys by the Surveyor General. This will remove one of the greatest objections to the working of the forest homestead law. The officials of both the Department of Agriculture and the Department of the Interior are pleased that the way has been found, through co-operation in the surveys, to simplify the procedure, cut out a duplication of work, and lessen the cost of settling upon agricultural lands within national forests.

COST OF PUMPING WATER.

The chief items of expense in pumping water are for fuel, attendance, repairs and fixed charges. The latter include interest on investment, depreciation, taxes and insurance, and vary from 12 per cent of the original cost of the plant to 20 per cent per annum, depending both on the skill of operation and the grade of machinery installed. As these fixed charges must be met whether the plant is used or not, they form a large part of the total cost of pumping in cases where the plant is operated only for a short time each year. A part of this expense is, however, properly chargeable to crop insurance. A small plant will insure against the total faliure in a dry year of valuable crops, and in some cases may save the life of trees and prevent the loss of years of toil. The saving of one crop in a dry year will pay the fixed charges of several normal years many times over.

In gasoline plants with gasoline at 7½ cents a gallon, the cost for fuel alone is about 5 cents per acre-foot raised one foot. If the water has to be raised 20 feet and two acre-feet are used for irrigation, the fuel cost for the season would be $2 per acre. Repairs and attendance are an additional charge. Such plants consume about one-eighth gallon of gasoline an hour for each indicated horsepower.

In motor driven plants, with electric current selling for two cents per kilowatt hour, the cost for power alone is about 6 cents per foot acre-foot, or 20 per cent more than for gasoline plants. The comparison is unfair, however, as the cost for attendance and repairs is considerably lower than for gasoline plants.

In steam driven plants with crude oil at 2 cents a gallon, the cost for fuel is about 3 cents per foot acre-foot. This figure cannot be fairly compared with those for gasoline or electric plants, as it is the average cost for a number of large plants costing $5000 to $50,000, and the unit cost of power in a large plant is less than in a small plant.—Irrigation.

ABATE THE NUISANCE.

State Forester G. M. Homans says that "recent investigations of cut over lands in Eldorado, Mono and Plumas Counties show that many of the slashings constitute a fire trap," and he urges the owners to clear them up before the next fire season.

When asked whether the law compelled the owners of logged off land to make a safe disposal of the debris, Homans said: "Chapter 392, Laws of 1911, provides that the State Board of Forestry may cause an inspection to be made of any forested area to determine whether or not its condition endangers life or property. Dangerous areas are declared by law to be a public nuisance, and must be abated by the owner within a designated time, otherwise the State Board of Forestry performs the necessary work, and the expense incurred becomes a lien upon the property."

"The board is ready at all times," says the Forester, "to assist in clearing up old slashings by offering suggestions, or by preparing working plans after an examination has been made on the rground."

"Owners of summer resorts," he says, "should co-operate in the construction of fire lines, and in maintaining a paid patrol during the dangerous season." Fire plans will be prepared by the Forester's office upon request."

UNITS OF MEASUREMENT OF WATER.

The quantity of water used for irrigating an ordinary farm is so large that it is convenient to have a large unit of measurement. The acre-foot is such a unit, and is the amount of water that will cover one acre to a depth of one foot. It is convenient to use, as one can see at a glance that one acre-foot of water will irrigate two acres six inches deep, three acres four inches deep, etc. In old well developed irrigated sections water is commonly sold by the acre-foot.

But water can very seldom be measured in acre-feet, and hence some unit for the rate of flow must be used. The cubic foot per second is a particularly good unit, since one cubic foot per second will deliver very closely two acre-feet a day (24 hours). It is also the unit used in all stream measurements.

For pumping, the gallon per minute is used, 450 gallons per minute being equal to one cubic foot per second.

The miner's inch is an indefinite unit, depending on the head of water above the orifice. For correct measurement the head should be taken to the center of the orifice in every case. Under six-inch pressure the miner's inch is 1-40 cubic feet per second, nearly.

Eucalyptus Planting Near Delano, Kern County —Courtesy Delano Record.

The passage by the senate of the congressional apportionment bill increasing the size of the house from 391 to 433 members will make an electoral college numbering 525 with 263 votes necessary to a choice.

CONTENTS THIS WEEK

BURBANK'S GIANT AMARYLLIS, Cover.

IMPORTANCE OF IRRIGATION DISTRICTS, 417.

CITRUS AND TROPICAL FRUITS.—Cost of Available Nitrogen; Control of Citrus Pests in Arizona; 418, 419.

DECIDUOUS FRUIT CULTURE.—The Canning Business; Apple Show in Windows; Toads' Busy Evening; 420, 421.

SMALL FRUITS AND VEGETABLES.—This Month; Seeds from Foreign Lands; 422.

ORNAMENTAL GARDEN.—This Month; Carnation Culture; Lilium Harisii; Pruning Shrubs; 423.

BEES AND THEIR CARE.—European Foul Brood; 424.

SUCCESSFUL IMPLEMENT HOUSE; 425.

IRRIGATION AND FORESTRY.—Making the Map of California; Homesteader's Burden; Abate the Nuisance; Units of Measurement; 426, 427.

EDITORIAL.—Farmers' Institutes; Come to California; National Sheep Show; Roses Everywhere; Swat the Fly; Adulteration; Prices of School Bonds; Review of Crops; Valuable Report; Boosting California; Corn; Up-to-dateness; Dishonest Water Companies; Real Cause of Prosperity; 428.

AGRICULTURAL NEWS NOTES OF THE PACIFIC COAST.—Northern; Central; Southern; The Coast; 429.

LIVE STOCK AND DAIRY.—Aids in Selecting Breeding Stock; Italian Proverbs; From Milk to Millions; Danger in Feeding Root Crops; Concerning the Nubian Goat; 430, 431, 432.

VETERINARY.—Ring Bone; Strychnine Poisoning; Bitter Milk; 432.

PROFIT IN THE POULTRY YARD.—When to Hatch Eggs; Orange County Poultry Show; Poultry as a Business Enterprise; Neglected Guinea Fowl; Chicken Mite; Tainted Eggs; Points to Remember; 433, 434, 435.

GENERAL AGRICULTURE.—Cheaper Automobiles; Concrete Materials; Auto and the Boy; 437, 438.

QUESTIONS AND ANSWERS.—Varieties of Peach; Applying Lime; Weevil in Bran; Best Breed; Self Milker; Pruning Oranges; Grapes Splitting; Plowing Under Green Manure; Icing Cars; Black Scale on Olives; Fumigating Lemons; 439, 440.

HOUSEHOLD.—When the Sun Goes Down; Who Will Go A'Maying; How Much Fresh Air; Revising National Anthem; Window Cleaning Hints; Homely Hints; Watermelon Preserves; Washing Fluid; 441, 442, 443.

PRODUCE MARKET.—Los Angeles Market; San Francisco Market; Deciduous Market; Citrus Market; 444, 445

FARMERS INSTITUTES.

J. B. Neff, Conductor of Farmers Institutes for Southern California, announces institutes at Independence, Inyo County, November 13-14; Bishop, 15-17.

COME TO CALIFORNIA.

The National Irrigation Congress, which meets in Chicago next month, will have two invitations for its next gathering from California, one from San Francisco and one from Los Angeles.

NATIONAL SHEEP SHOW.

The preliminary premium list of the National Sheep Show, which will be held in Omaha, Nebraska, December 13-16, is being mailed. Special premiums which will aggregate $2,000 in cash will be offered, and special cups and premiums in addition valued at $2,500.

ROSES EVERYWHERE.

A rose grower at Pomona has suggested that all Southern California make a rose planting campaign, planting roses on all roadsides and in every nook that may be found. This is along the line of the campaign which the Cultivator has made for preparation for our hosts of visitors who will be in California through the next few years. The amendment which we would make to the Pomona grower's suggestion is that Southern California be changed by making it all California. Let every community in the state get busy.

SWAT THE FLY.

Prof. Wm. B. Herms has made a consistent fight on the house fly, mosquito, and other pests of nearly all other sections of the state. His Bulletin No. 215 gives particulars as to prevention of the fly pest by giving no place for their breeding. Thorough surveillance on the part of all would soon make unnecessary any exhortation to swat the fly. At this season of the year there is less occasion to call attention to this pest, so far as immediate discomfort and inconvenience are concerned, but it is a good time to prepare for next year.

ADULTERATION.

It hardly seems that the statements in the circulars sent out by the Department of Agriculture can be true. In one reporting adulteration of black olives it is stated that 32 per cent of the olives were passable, 7.4 were wormy, 32 per cent worm eaten, and 28 per cent decayed. We are glad to say these were not California packed olives, but were in original unbroken packages as received from Europe, and yet Eastern consumers may yet be found who declare that California olives are not as good as the imported green olive.

PRICES OF SCHOOL BOOKS.

State Superintendent of Public Instruction Hyatt is after the book dealers who are charging excessive prices on school books. The state law is explicit in this matter. A particular case in which the superintendent used his power was brought to his attention by a complaint from Mono County. A Stockton dealer had demanded a higher price for books than fixed by law by selling to students at the regular price and adding postage. The dealer had been active in soliciting mail orders in that section. The punishment meted out to him is forfeiture of right to handle school books of the State of California. Any reader of the Cultivator who knows of cases of similar violation should get in touch with the state superintendent.

REVIEW OF CROPS

The last review of crop conditions over the country showed a much more favorable close to the season than was indicated earlier. The extended drouth of a few weeks in June and July caused great damage in all portions of the country east of the Rockies, but on October 10th the conditions the country over showed 114 per cent, taking 100 per cent as representing average condition (not normal). Cotton was 106.9; lemons 104.6; pears 103.6; grapes 103.4; sugar beets 102.4; oranges 101.6. Lima beans show percentage of full crop of 78.2; other dry beans 77.4.

VALUABLE REPORT.

The State Horticultural Society of Washington has changed the date of its next meeting from early in December to January 4-6. The secretary reports the membership greatly increased from last year. Unlike California, the Washington association is maintained by regularly elected members who pay dues. It is a state organization in name rather than through state support. There are now 750 members of the association, and it is announced that this will be raised to 2,000 if possible. Members are enrolling from other states because of the desire to secure the report, which is of value, as it gives a full transcript of the proceedings of the convention.

BOOSTING CALIFORNIA.

The Southern Pacific is making a great effort to see that California is fully represented at the Chicago Land Show, which opens on the 18th of this month. The Southern Pacific has the largest allotment of space of any exhibitor at that show, as it did last year. So far Alameda, Tulare, Los Angeles and San Diego Counties have joined with the railroad people in this effort. It is now rather late, but any community which has any feature worthy of exhibiting at that show that will attract attention to the state's possibilities of production should inform the nearest Southern Pacific agent. Free transportation will be given any exhibit.

CORN.

California is not much on the production of corn, yet it now costs practically as much as wheat where one buys in small quantities. There are certainly varieties which will be found to do well under our conditions. That they have not yet been found is indicated by the fact that during the decade 1900-1910 there was a decrease of 1995 acres devoted to corn. This amounted to 3.7 per cent, not a great decrease, but not as encouraging as a good rousing increase would have been. Some of our more careful growers are now experimenting with different varieties which will do well under California conditions. They should be aided in every way possible, and the vast amount of money paid for freight on Middle West corn should be saved to the state.

UP-TO-DATENESS.

We trust the figures given for modern home equipment in the state of Missouri would not apply to California. Better than that, we are sure they would not. A writer in the November World's Work, in reporting conditions in Missouri, says:

"For all our twentieth century up-to-dateness, there are some places where the 'modern' home is still rare. According to reports made to the Missouri State Board of Agriculture, less than 2 per cent of the farm homes are provided with water systems, less than 3 per cent have furnace or other up-to-date heating systems, and less than 4 per cent have gas or other modern lighting systems; and Missouri farms are believed to be far above the average throughout the country."

There is no reason why the modern farm home should not have practically all the conveniences of the city home, and we believe California farmers demand these conveniences and often make farm life even more attractive than city life.

DISHONEST WATER COMPANIES

A land owner who had purchased for his lands water right on the supposition that he was purchasing water recently called at this office and entered his complaint against water companies overselling their supply. In his particular case he had bought sufficient water shares, as he supposed, to abundantly cover his ten acres, but the company continued to sell its stock beyond all reason, and he found his water right one in name only, and his only hope is to join with his neighbors in a pumping scheme to secure water to keep his trees alive. We will not say this is a common case in this state, but there have been too many such instances. Dishonest promoters of water companies secure enough tangible rights to make a good showing, and then, owing to pressure from the outside or their own greed, allow this water to be so thinly distributed that all parties are injured. It is not the few dollars taken for the right which is the greatest injury; it is the years of work to bring an orchard to bearing age, only to find it absolutely worthless because there is no water to keep it going. The state should be albe to take a hand in such affairs.

REAL CAUSE OF PROSPERITY.

Some years ago Henry E. Huntington acquired large interests in Los Angeles and took charge of its street railways, establishing one of the best interurban systems in the world. It has been the custom of the papers of that city to refer to Mr. Huntington's great work, to the great debt of gratitude due him, and to give him credit for practically all the advancement of the city. More recently there has been some rebellion against this wholesale credit giving to one man. A late address called attention to the fact that there was also credit due to the city and to the people who had worked for it in creating conditions which enabled Mr. Huntington to make great wealth for himself because of this work of others. This address seemed to strike a responsive chord and there has been a casting up of benefits, and while the trial balance may never show with exactness where all credit belongs, it is generally conceded that it is not all one-sided.

The same argument also obtains as to prosperity of town and country. Chambers of commerce and other promotion organizations of some enterprising cities gather to themselves all the credit for advancement and growth, but back of it all is the productiveness of the farm. There are few successful communities in this world which were not surrounded by productive lands in charge of brainy and intelligent workers. The foundation of all wealth is the soil, and in proportion as there are brainy men handling it, prosperity will come. We feel that some of the credit for our country's advancement should be given where it is due and at other than political speeches when the horny handed son of toil is lauded—for political effect.

Agricultural News Notes of the Pacific Coast

Northern California

Meridian, Sutter County, claims a 75-pound squash.

Healdsburg wineries are paying $20 per ton for grapes.

The new creamery is in operation at Quincy, Plumas County.

Biggs, Butte County, claims ripe oranges as early as October 17th.

Prof. Loughridge addressed the farmers in institute held at Napa last week.

Sutter County's bean and prune crop were both larger than for many years.

Sonoma County Pomona Grange met in regular session at Santa Rosa last Wednesday.

The date fixed upon for the citrus fair at Oroville, Butte County, is December 4 to 9.

One prune grower at Colusa will clean up between $40,000 and $50,000 from this year's crop.

Poultry fanciers at Livermore, Alameda County, are planning for a show to begin February 8th.

Apple growers of Cohasset, Butte County, claim 16 prizes won at the Watsonville Apple Show.

Nearly 4500 acres of delta land near Lodi have been purchased and will be subdivided and colonized.

Over 5000 tons of grapes have been crushed and made into wine on the Vina Ranch in Tehama County.

Contract for plowing 2600 acres of land has been let on lands near Maxwell and Delvan in Colusa County.

The river sections are now sending in large steamer loads of potatoes, beans and onions to San Francisco.

A 1000-acre tract at Nord, Butte County, has been purchased by capitalists who will plant it entirely to hops.

Although Butte County's orange shipments have already started, heavy shipments will not be taken up until late in the month.

To raise 1829 bushels of sweet potatoes, worth $2,267.96, on an acre is the record made by a farmer in the Los Molinos irrigated district.

The Alameda County Poultry Show to be held later this month, will be judged by Harry H. Collier, Tacoma; R. J. Venn of Fresno and L. N. Cobbledick, Oakland.

Prof. Elmore Chase, horticultural inspector at Fair Oaks, Sacramento County, maintains that Johnson grass is easily controlled by persistent and intelligent effort.

Palermo, Butte County, claims the honor of the first shipment of citrus fruit for this season. The shipment amounted to 2500 boxes and was made to Australia, leaving San Francisco October 30th.

A grape grower now in the East writes to Lodi growers that he believes the loose pack of grapes to be the best and that the square tin top of the ordinary basket is "a fine medium for the growers to drive nails in their own coffins."

The Alameda Sugar Company has done extensive purchasing and bonding of lands in western Sutter and northeastern Yolo Counties, and it is rumored that a twenty-ton factory will be erected near Meridian, and that the plant will cost $2,400,000.

Central California
